Outline

- Regulatory Needs & Challenges
- Current and Future Applications:
  - QSAR models (EPA, FDA)
  - TSCA Prioritization
  - Endocrine: CERAPP/CoMPARA
  - Skin Sensitization: Defined Approaches
  - Acute Oral Toxicity: Predictive Models

Environmental Chemical Disease Contributions

- Pesticides
  - Cancer, neurodegenerative diseases, thyroid
- Consumer products
  - Neurological, developmental, systemic
- Air pollutants
  - Childhood ADHD, autism, allergic asthma
- Drinking water contaminants
  - Systemic effects, cancer, neurological
- Endocrine Disruptors
  - Developmental impairment, decreased fertility, cancer

…….and many others…….

https://www.niehs.nih.gov/health/materials/index.cfm

Chemicals >> Data

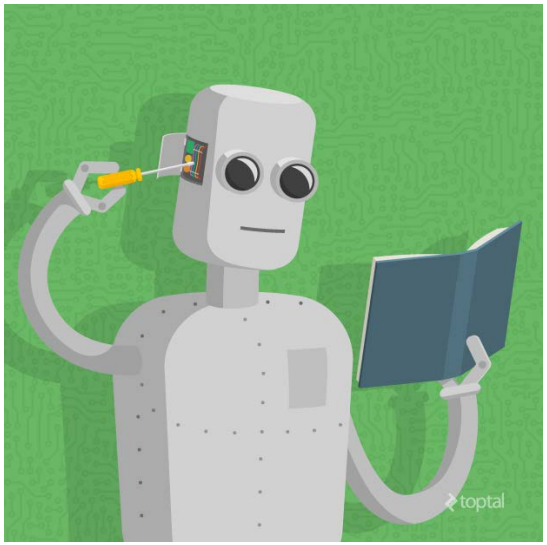
- 80+ million substances synthetized
- 140,000 chemicals in commerce (plus mixtures, natural products and metabolites)
- Less than 10% tested

Curated Legacy Data

e.g. REACH, ToxRefDB, ICE

High-Throughput Screening

e.g. ToxCast, Tox21



Omics techologies

e.g. transcriptomics, metabolomics, exposomics

High-Content Imaging

e.g. EuToxRisk

Current Regulatory Use of ML: Structure Based Models

- EPA/OPPT: Predictive Methods to Assess Hazard under TSCA
  - EcoSAR, OncoLogic, EPISuite
- FDA/CDER, CDRH: Genotoxicity and Carcinogenicity
  - Bacterial mutagenicity (expert-rule based & statistical)

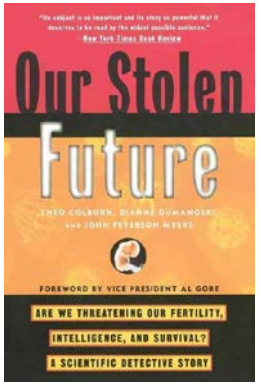
1993, Environmental Health Perspectives



Legislative Mandates:

1996 Federal Food, Drug and Cosmetic Act
1996 Safe Drinking Water Act Amendments

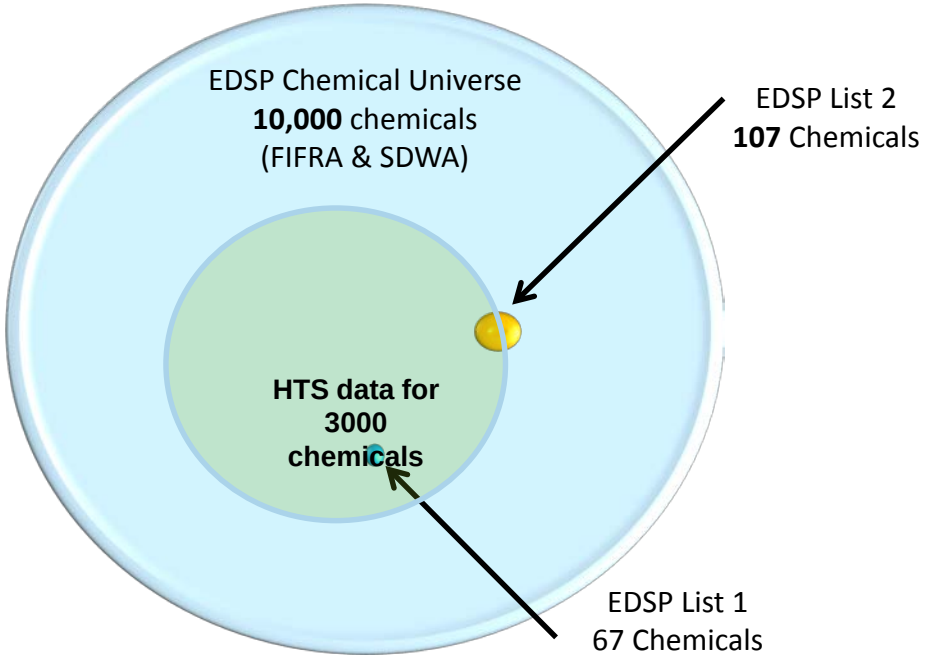
U.S. EPA EDSP

Evolution of the Endocrine Disruptor Screening Program

EDSP Tier 1 Testing: for the purposes of prioritization and screening, identify chemicals with the potential to disrupt estrogen, androgen, or thyroid hormone receptor signaling.

Mismatch between resources needed for EDSP Tier 1 testing and the number of chemicals to be tested

- ~$1M per chemical for Tier 1
- 11 low-throughput & animal tests

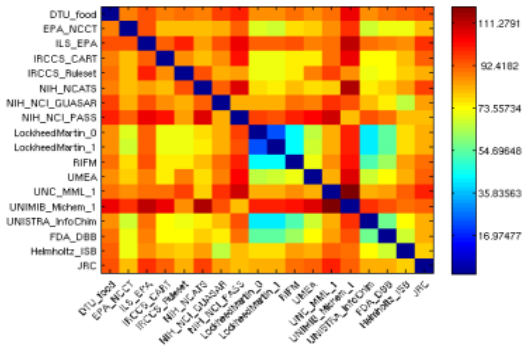


New Approach: **EDSP + Tox21 = EDSP21**

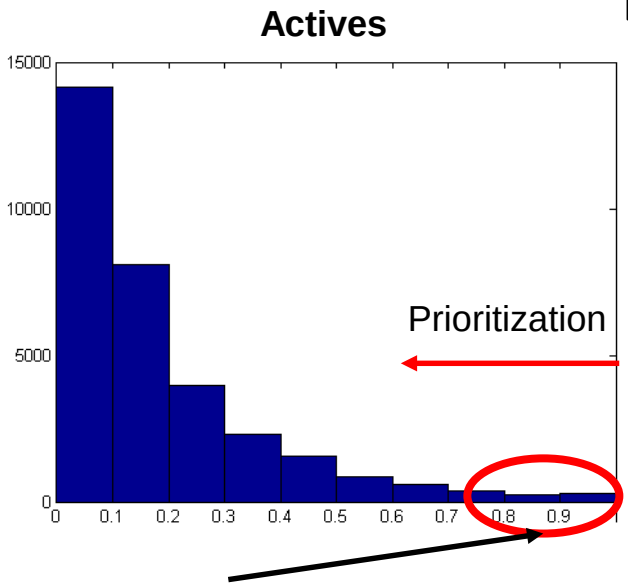
- Pathway-based predictive models (HTS in vitro assays)
- Validate to replace selected Tier 1 screening assays
- Train QSAR models to prioritize chemical universe

ER/AR QSAR Models

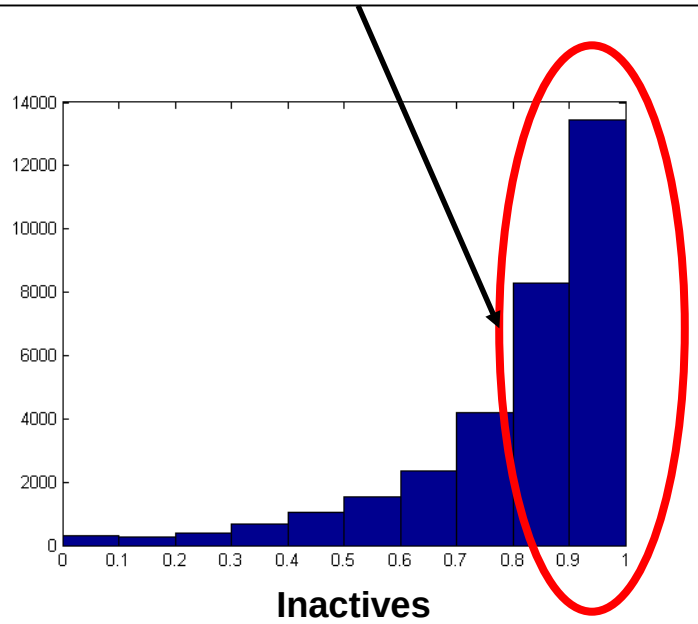
- Training set (ToxCast): 1677 chemical structures
- CERAPP: Global collaborative project for ER
  - 17 international groups participated
  - Individual and consensus models
  - *Mansouri et al. 2016 EHP*
- Prediction Set (EDSP):
  - 32,464 chemical structures
  - 5-10% predicted to be ER-active: Prioritize for further testing
- COMPARA: Global collaborative project for AR
  - 34 international groups participating
  - *Mansouri et al. 2018 in prep*



Correlation matrix of the CERAPP continuous ER models predictions



Most models predict most chemicals as inactive



757 chemicals have >75% positive concordance

Consensus Modeling: Powering Prediction Through Collaboration

Predictive computational models can efficiently help us prioritize thousands of chemicals for additional testing and evaluation. CSS scientists Kamel Mansouri and Richard Judson, from the U.S. EPA's National Center for Computational Toxicology (NCCT), led a large-scale modeling project called the Collaborative Estrogen Receptor Activity Prediction Project (CERAPP). CERAPP demonstrated the efficacy of using computational models with high-throughput screening (HTS) data to predict potential estrogen receptor (ER) activity of over 32,000 chemicals. This international collaborative effort (17 research groups from the United States and Europe) used both quantitative structure-activity relationship models and docking approaches to evaluate binding, agonist and antagonist activity of chemicals. A total of 48 models were developed. Each model was evaluated and weighed for its predictive accuracy using ToxCast and

Integrated decision strategies for skin sensitization hazard

Judy Strickland[a], Qingda Zang[a], Nicole Kleinstreuer[a], Michael Paris[a], David M. Lehmann[b], Neepa Choksi[a], Joanna Matheson[c], Abigail Jacobs[d], Anna Lowit[e], David Allen[a] and Warren Casey[f]*

ABSTRACT: One of the top priorities of the Interagency Coordinating Committee for the Validation of Alternative Methods (ICCVAM) is the identification and evaluation of non-animal alternatives for skin sensitization testing. Although skin sensitization is a complex process, the key biological events of the process have been well characterized in an adverse outcome pathway (AOP) proposed by the Organisation for Economic Co-operation and Development (OECD). Accordingly, ICCVAM is working to develop

Silvia Casati, JRC

Defined Approach Evaluation

Most non-animal defined approaches evaluated so far perform **better** than the LLNA at predicting human skin sensitization hazard and potency.

(And when compared to the LLNA, are equivalent in performance to the LLNA at predicting itself.)

International Harmonization

- OECD proposal (SPSF) submitted November 2016
  - Co-led by U.S., EU, and Canada
  - Create an international performance based test guideline for non-animal defined approaches to skin sensitization testing
  - Achieve widespread replacement of mouse test
- National coordinators (WNT) voted unanimously to include the project in OECD workplan, April 2017
- Special session of the WNT met in December 2017 to review progress and discuss next steps
  - Achieved consensus on evaluation framework for consideration and assessment of DAs

OECD BETTER POLICIES FOR BETTER LIVES

Rat oral acute toxicity: LD50 Database

- Multiple existing resources containing rat oral acute toxicity LD50 data were mined and merged

Data source	Number of LD50 values	Number of unique chemicals
ECHA ChemProp	5,533	2,136
NLM HSDB	3,981	2,205
JRC AcutoxBase	637	138
NLM ChemIDplus	13,072	12,977
NICEATM PAI	364	293
OECD eChemPortal	10,119	2,290

Total:
34,511 LD50 values
16,307 chemicals

↓ Identify unique data in mg/kg

21,210 LD50 values
15,698 chemicals

- LD50 data comprised point estimates as well as limit tests

Agnes Karmaus, ILS/NICEATM

Development of Predictive Models for Acute Oral Toxicity

- International modeling community invited to build models to predict acute oral systemic toxicity
- ICCVAM agencies informed model endpoints
- Training and test data derived from large dataset compiled by NICEATM and EPA/NCCT
  - 11,992 QSAR-ready structures (75% training, 25% test)
  - Quantitative & qualitative evaluation
  - Models will be integrated to yield consensus predictions

https://ntp.niehs.nih.gov/go/tox-models

Endpoints to be Modeled

Participants are asked to develop models for any/all of the following endpoints identified based on regulatory needs provided by ICCVAM agencies:

1. Very toxic (< 50 mg/kg vs. all others)
2. Nontoxic (>2000 mg/kg vs. all others)
3. LD50 point estimate
4. EPA hazard categories (n=4)
5. GHS hazard categories (n=5)*

*GHS categories 5 and “not classified” are combined into one category

Modeling Approach

- Modelers are encouraged to consider different modeling approaches
  - Machine learning, global/local, hybrid/consensus models, etc.
- Models could include any variety of data inputs:
  - Chemical features/structure classes, physiochemical properties, product use categories, production volumes, in vitro data (measured or predicted), etc.

Evaluation Criteria

The OECD QSAR validation principles to be considered as guidance:

1. **A defined endpoint**
2. **An unambiguous algorithm**
3. **A defined domain of applicability**
4. **Appropriate measures of goodness-of–fit, robustness and predictivity**
5. **Mechanistic interpretation, if possible**

Timeline

- **November 17, 2017:** Release of Training Data to the public**.**
- **December 15, 2017:** Release of Prediction Data to the public.
- **February 9, 2018:** Deadline for submission of model results and documentation to NICEATM.
- **March 9, 2018:** Organizing Committee finalizes selection of models to be invited for platform presentations and notifications are sent to presenters.
- **April 11-12, 2018:** Predictive Models for Acute Oral Systemic Toxicity Workshop, NIH Natcher Conference Center, Bethesda, MA.

https://ntp.niehs.nih.gov/go/tox-models

Summary

- Toxicology data can be synthesized and modeled effectively using machine learning approaches.
  - Also: exposure, use case, systematic review, etc.
- Machine learning models (i.e. QSARs) have already achieved limited acceptance in the regulatory space.
- Additional education, training, and communication will facilitate more widespread adoption.
