

Handbook for Preparing Report on Carcinogens Monographs

Standard Search Strings for Literature Database Searches for Preparing Report on Carcinogens Monographs

Updated July 26, 2023

Foreword

National Institute of Environmental Health Sciences (NIEHS) is one of 27 institutes and centers of the National Institutes of Health, part of the U.S. Department of Health and Human Services. The NIEHS mission is to discover how the environment affects people in order to promote healthier lives. NIEHS works to accomplish its mission by conducting and funding research on human health effects of environmental exposures, developing the next generation of environmental health scientists, and providing critical research, knowledge, and information to citizens and policymakers, to help in their efforts to prevent hazardous exposures and reduce the risk of preventable disease and disorders connected to the environment. NIEHS is a foundational leader in environmental health sciences and committed to ensuring that its research is directed toward a healthier environment and healthier lives for all people. Division of the Translational Toxicology (DTT) at NIEHS. NIEHS/DTT scientists conduct innovative toxicology research that aligns with real world public health needs and translates scientific evidence into knowledge that can inform individual and public health decision-making.

The National Toxicology Program prepares the Report on Carcinogens (RoC), a science-based public health document, for the Secretary, Department of Health and Human Services. The Report on Carcinogens staff is responsible for carrying out this activity within DTT/NIEHS and prepares a monograph for each substance evaluated for listing in the RoC (i.e., a candidate substance). The monograph is a literature-based review document that captures the cancer hazard evaluation.

The [Handbook for Preparing the Report on Carcinogens Monographs](#) (RoC Handbook) describes systematic review and evidence integration methods for conducting a cancer hazard evaluation of an agent, substance, mixture, or exposure circumstance (collectively referred to as a “substance”) selected for review for possible listing in the Report on Carcinogens (RoC). This living document provides a series of standardized citation database search strings for the key topic areas addressed in the cancer hazard evaluation: human exposure, human cancer studies, cancer studies in experimental animals, mechanistic studies and other relevant data (such as absorption, distribution, metabolism and excretion, ADME), which complement the literature search strategy described in the RoC Handbook. The purpose of standardized search strings is to ensure that the searches for all candidate substances are consistent, reproducible, and transparent. The search strings were originally posted on the NTP website in 2016. This update provides new terms for search terms selected characteristics of carcinogens (including epigenetics changes, receptor mediated effects, and chronic information and immune modulation), metabolomics, and human exposure. This document will serve as a living document, being updated periodically as standard search strings are changed or added.

About This Report

National Institute of Environmental Health Sciences

Division of Translational Toxicology, Report on Carcinogens Group/Integrative Health Assessment Branch, Research Triangle Park, North Carolina, USA

Whitney D. Arroyave, Jessica A. Geter, Rachel Kalsch, Stanley T. Atwood, William H. Bisson, Andrew D. Ewens, Sanford C. Garner, Amy Wang, Ruth M. Lunn

Collaborators

National Institute of Environmental Health Sciences, Research Triangle Park, North Carolina, USA

Responsible for oversight and coordinating and input on developing the search string document

Ruth M. Lunn, DrPH (project leader)

Contributed to developing the search strings

Gloria Jahnke, DVM (retired), (currently at Agoyx)

Amy Wang, PhD

Suril S. Mehta, DrPH

ILS, Inc., an Inotiv Company, Research Triangle Park, North Carolina, USA

Contributed to the coordinating activities and drafting of the search string document

Whitney D. Arroyave, PhD (ILS/Inotiv project manager)

Contributed to creating the initial draft of the standard search strings

Jessica A. Geter, MSLS (no longer with ILS/Inotiv)

Contributed to updating search strings, creating new search strings, or both

Stan Atwood, MS (retired)

William H. Bisson, PhD

Andrew D. Ewens, PhD

Sanford C. Garner, PhD (retired)

Rachel Kalsch, MLIS

Alton F. Peters, MS

Contributors

ILS, Inc., an Inotiv Company, Research Triangle Park, North Carolina, USA

Provided technical input on search strings

Lara Hander, MSLS (no longer with ILS/Inotiv)

M. Elizabeth Hodgson, PhD

Pamela J. Schwingl, PhD (retired)

Provided administrative assistance and document preparation

Tracy L. Saunders, BS

1. Introduction

This document provides a series of standardized citation database search strings for the key topic areas addressed in the cancer hazard evaluation: human exposure, human cancer studies, cancer studies in experimental animals, mechanistic studies, and absorption, distribution, metabolism, and excretion, ADME), which complement the literature search strategy described in the Handbook for Preparing Report on Carcinogens Monographs. The search terms that make up the strings were collected by an information specialist and reviewed and edited by the subject matter experts of RoC and other NIEHS staff before being structured into appropriate syntax for each database and tested.

For each substance under review, a unique search string is created to identify literature associated with the substance. In some cases, the literature on a candidate substance is limited and it is simpler to evaluate and categorize all the associated literature. However, in most cases the literature pool is large, and narrowing searches are used to help focus on the data more relevant for evaluating potential cancer hazards. This narrowing is accomplished by combining the candidate substance search in various ways with the standardized search strings to retrieve the intersection of potentially relevant results (see Figure 1).

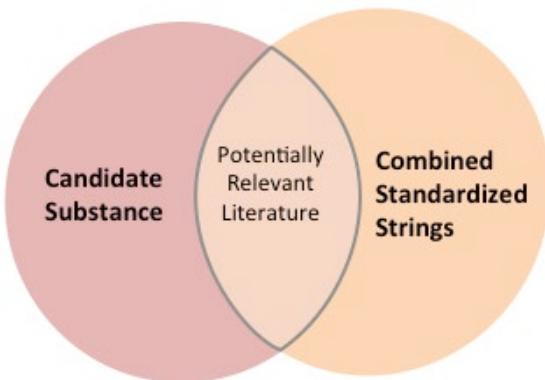

Figure 1. Intersection of search strings to identify potentially relevant literature.

Searches for cancer studies in humans and experimental animals are conducted using standardized search strings for epidemiologic (human) studies (section 2.3) and experimental animal studies (section 2.4) in combination with the cancer search strings (section 2.2) prior to combining with the candidate substance search strings. The human exposure (section 2.1), ADME Search Strings (section 2.5), and searches for mechanistic data (Section 2.6) would not normally be combined with the Cancer search, but are intersected directly with the candidate substance.

2. The Searches

2.1. Human Exposure

The search terms below are used as part of the Human Exposure section of the document. These search terms are combined with the substance specific search terms.

These terms were added to the search string document in June 2022.

2.1.1. Exposure Search Strings

PubMed

[Return to table of contents](#)

2.2. Cancer

The goal of this search is to provide a set of “narrowing” terms to focus on cancer topics as opposed to other adverse effects or health outcomes. In some cases, it may be used directly against the results of the search for the candidate substance. It is generally used in combination with the human (epidemiology), or the experimental animal studies search strings.

This search string was developed primarily by removing terms from the PubMed Cancer filter to make it more focused on the topics of interest for cancer hazard literature-based evaluations captured in the RoC monographs. It still returns a broad literature set associated with cancer.

Types of terms removed from the PubMed Cancer Filter include:

- Cancer testing/screening methods
- Cancer treatment methods
- Caregivers/Medical specialty (Oncologist, Oncology, etc.)
- Journal names
- Oncogenic virus names (can be searched specifically when applicable)
- Organization names

2.3. Human Cancer Studies

The goal of the search for the human cancer monograph section is to identify human studies (primarily epidemiologic) that have assessed exposure to a specific candidate substance and a cancer outcome. The Epidemiological (Human) Studies Search Strings (below) would be used in combination with the Cancer Search String (Section 2.2) to focus on the most relevant literature.

Epidemiological (Human) Studies Search Strings (below) are intended to identify an exhaustive list of epidemiologic studies in humans fitting the following types:

- Case reports and case series
- Cohort studies
- Case-control and case-referent studies
- Ecological studies
- Meta-analysis
- Workers (some epidemiological studies are defined in the title, abstract, and key words as studies of workers rather than by a specific study design)

Note that the search strings provided here are not the only method by which human studies may be identified for the RoC. The mechanistic searches, mining the citations of reviews and other studies, and specially targeted searches are additional methods of identifying human/epidemiologic studies.

The focus of the search string is to collect epidemiological or clinical studies of human subjects and not necessarily other types of studies with humans. Therefore, various terms that might be expected (such as age groups) are not included.

These search terms were updated in June 2022.

2.4. Cancer in Experimental Animals

The goal of the literature search for the animal cancer section of a RoC Monograph is to identify studies that inform whether a substance causes cancer in experimental animals. The Experimental Animals Studies Search Strings (below) are used in combination with the Cancer Search Strings (Section 2.2) to focus on the most relevant literature.

Note, however, that the search strings provided here are not the only methods by which animal studies may be identified. The mechanistic searches, mining the citations of reviews and other studies, and specially targeted searches are additional methods of identifying cancer studies in experimental animals.

The terms for the Experimental Animals Search Strings were selected to focus on experimental studies with the following characteristics:

- In vivo
- Non-human mammalian subjects

2.6. Mechanisms

The goal of the literature search for the mechanism monograph section is to ensure that the selected biological processes are adequately explored to provide clarification and support to an understanding of the carcinogenic effects of the candidate substance, and biological plausibility for the effects observed in humans or experimental animals.

Search strings for the following concepts pertain to this section: Key Characteristics of Carcinogens (KCCs), Metabolomics, and General Mechanistic Terms.

2.6.1. Key Characteristics of Carcinogens Search Strings

The search strings provided below each target a characteristic of carcinogens as defined in Smith *et al.* (2016) and Zhang *et al* (2023). These searches are intended to locate literature relevant to the Mechanistic and Genotoxicity sections of a monograph. They are not generally used in conjunction with the Cancer Search Strings. To search for two or more KCCs simultaneously, combine the searches with the Boolean operator OR. The terms included for each KCC are not mutually exclusive, as some mechanistic concepts are relevant to more than one of the KCCs.

The ten Key Characteristics of Carcinogens:

1. act as an electrophile either directly or after metabolic activation
2. be genotoxic
3. alter DNA repair or cause genomic instability
4. induce epigenetic alterations
5. induce oxidative stress
6. induce chronic inflammation
7. be an immunomodulator
8. modulate receptor-mediated effects
9. cause immortalization
10. alter cell proliferation, cell death, or nutrient supply

2.6.2. Metabolomics Search Terms

This search string captures terms related to metabolomics, a developing field. Articles on metabolomics are of interest if they provide mechanistic context, either by a formal pathway analysis, or from content or analyses showing the metabolites are relevant to cancer. Articles listing metabolites without context relevant to cancer mechanisms would not be of interest.

These search terms are used in combination with the substance specific search terms with the Boolean operator “AND”. This search string is not used in conjunction with the cancer search string.

2.6.3. General Mechanistic Terms Search Strings

This search is a limited set of terms designed to supplement the Characteristics of Carcinogens Search Strings and uses terms not included in that search. It will generally be used to gain an initial grasp of the best-understood mechanistic information associated with the candidate substance. This search is not generally used in conjunction with the Cancer Search Strings.

Some additional information about the mechanism of action for a material can be collected from general data sources, mining the citations of reviews and other studies, and specially targeted searches.
