Testing and Toxicology Studies in FY 2020

APPENDIX II

The NTP testing program evaluates substances for a variety of health-related effects, generally using rodent models. For each test article, a study team develops an appropriate testing strategy to address the identified research needs. Reports and summaries of NTP toxicity studies, including carcinogenicity and effects on development and reproduction, are available on the NTP website. Studies initiated, ongoing, or completed in 2020 are listed in this appendix.

Disposition, Metabolism, and Toxicokinetic Studies

Complete dosimetry of a chemical or physical agent describes its absorption, distribution, metabolism, and excretion in the body of both humans and test animals at differing levels of exposure, of all ages, via several routes of exposure, and under varying genetic backgrounds. Substances evaluated during FY 2020 are listed below.

Modified One-Generation Reproduction Studies

NTP modified one-generation study design emphasizes a full evaluation of the first-generation offspring of animals and uses fewer animals than the classical multigenerational study design. These studies generate information on the effects of substances on prenatal development, postnatal development, and reproduction. Ongoing and completed modified one-generation studies are listed below.

Toxicity and Carcinogenicity Studies

NTP performs toxicity studies to provide dose-setting information for chronic studies and to address specific deficiencies in the toxicology database for the chemical. Toxicology and carcinogenicity studies fall into two categories: prechronic toxicity studies and chronic two-year toxicology and carcinogenicity studies. Studies are generally conducted in rats and mice.

Each study type is performed according to the Specifications for the Conduct of Studies to Evaluate the Reproductive and Developmental Toxicity of Chemical, Biological, and Physical Agents in Laboratory Animals for the National Toxicology Program (NTP) (May 2011). Prechronic and chronic toxicity studies and carcinogenicity studies that were initiated, ongoing, or completed during FY 2020 are listed below.

Toxicogenomic studies

NTP is incorporating the latest [toxicogenomic technologies](#), including next-generation (NextGen) sequencing, microarrays, and metabolomic analyses, into its testing program to gain further insights into the toxicity of environmental substances. Toxicogenomics examines how the entire genetic structure, or genome, influences an organism's response to environmental toxicants.

Toxicogenomic Studies Ongoing in FY 2020
