Overview

Introduction

Pertussis is a highly contagious disease caused by the bacterium *Bordetella pertussis*. In infants a pertussis infection is characterized by uncontrollable, violent coughing accompanied by a deep “whooping” sound when the patient tries to take a breath. Pertussis was formerly one of the most common childhood diseases of the early 20th century and a major cause of childhood mortality in the United States. In westernized countries, the incidence of pertussis has been reduced by more than 80% since the advent of a whole-cell vaccine in the 1940s. Public concern regarding some common side effects (e.g., fever, swelling at injection site) and serious events that occurred at very low frequency in temporal association with the use of whole-cell pertussis vaccines, led to the successful development of an acellular pertussis (aP) vaccine in the early 1980s. These new generation vaccines contain different combinations of the putative protective antigens of *B. pertussis* bacteria (e.g., inactivated pertussis toxin [PTx/d], pertactin, and fimbriae), and are less reactogenic than whole-cell vaccines.

Vaccine Lot Release Testing

Regulatory authorities require safety, potency, and purity testing prior to the release of each production lot of pertussis or pertussis-containing vaccines. The murine histamine sensitization test (HIST) is a key safety test used to monitor residual levels of pertussis toxin in acellular pertussis vaccines. This test is performed to ensure that pertussis toxin has been effectively inactivated before
release of vaccines. However, such testing may involve large numbers of mice, some of which can experience significant unrelieved pain and distress. The original lethal challenge test, based on the induction of increased sensitivity to histamine-provoked death in mice, has been modified to include measurement of rectal or body temperature as a humane endpoint to replace death. Currently, the United States and European authorities require the lethal challenge HIST assay while Japanese authorities and the World Health Organization accept the use of body temperature decrease as a replacement for the lethal endpoint. In addition, the HIST has technical challenges requiring frequent re-testing, thereby increasing vaccine testing expense. An international workshop organized in 2010 by NICEATM, ICCVAM, and their international partners identified the HIST as a priority for future research, development, and validation of alternative test methods that could further reduce, refine (enhance animal well-being and lessen or avoid pain and distress), or replace animal use for acellular pertussis vaccine safety testing.\(^1\)

**Recent International Meetings**

Recently, two international workshops reviewed currently available alternative *in vitro* assays to the HIST and discussed a path forward to achieve their validation and adoption\(^2,3\). The Workshop on Animal-Free Detection of Pertussis Toxin (PTx) in Vaccines – Alternatives to HIST was held on June 9 and 10, 2011, at the Paul Ehrlich Institute, Germany. It brought together interested stakeholders working on HIST alternative assays, defined regulatory acceptance criteria that would be required for any such alternative methods and established the International Working Group for Alternatives to HIST.

The Alternative Safety Testing Strategies for Acellular Vaccines Workshop was held as a satellite meeting to the 8th World Congress on Alternatives and Animal Use in the Life Sciences on August 21, 2011 in Montreal, Canada. This workshop further discussed and clarified regulatory agency requirements to achieve the acceptance of alternative methods to the HIST. Participants also discussed strategies for the adoption of international regulatory requirements based on the concept of consistency of manufacture. In addition, the workshop addressed the requirements and procedures for assay validation and comparability studies to be performed on pertussis toxin-spiked vaccine samples. Participants agreed that a study using spiked vaccines to compare the sensitivities of the HIST and *in vitro* assays would be important. It was also agreed that the direct correlation between the *in vivo* and *in vitro* assays was not required and attempting to correlate the data could be detrimental to the study outcome.

---

\(^2\) Workshop on Animal-Free Detection of PTx in Vaccines – Alternatives to HIST, Langen, Germany, June 9-10, 2011

\(^3\) Alternative Safety Testing Strategies for Acellular Pertussis Vaccines (8th World Congress Satellite meeting), Montreal, Canada, August 21, 2011
International Working Group for Alternatives to HIST

The International Working Group for Alternatives to HIST, composed of regulatory and industry participants, was established to facilitate the evaluation of alternative \textit{in vitro} methods for PTx measurement. The group coordinated the acquisition and distribution of acellular pertussis vaccine samples from manufacturers to research laboratories for generation of data on \textit{in vitro} methods on vaccines spiked with a known amount of PTx. A total of seven vaccines from three manufacturers (GlaxoSmithKline, Sanofi Pasteur, Statens Serum Institute) were provided to 12 international laboratories. The working group has been instrumental in determining an appropriate method for spiking vaccines with a known quantity of pertussis toxin, as well as establishing a framework for the development, evaluation, and validation of alternative methods. Data from various alternative assays using commonly spiked vaccines, as well as on the impact that adjuvants have on the assay performance will be presented at our workshop and will form the basis for selection of the \textit{in vitro} method or methods that will be assessed in the next international collaborative study.

Several \textit{in vitro} assays have been developed, or are currently under development, with the aim of finding an alternative method to HIST for monitoring residual PTx activity in acellular pertussis vaccines. The following methods will be evaluated and may be used to generate data to be presented at the upcoming workshop:

1. Binding assay: used to assess the amount of pertussis toxin/toxoid binding activity to the glycoprotein fetuin
2. Enzymatic assay: monitors the residual ADP-ribosylation of the pertussis toxin/toxoid
3. Cell-based assays: monitor the generation of cAMP or decrease in cellular ATP, following exposure to pertussis toxin
4. Genetic assays: determine potential genomic markers of pertussis toxin activity

This workshop will provide a forum to discuss and review the \textit{in vitro} protocols and available data from the international pertussis toxin spiked-vaccine study and will suggest future collaborative projects using prepared materials. The workshop will also review recent advances and innovations in science and technology that can be applied to new methods and approaches for acellular pertussis vaccine safety testing that are more humane, use fewer or no animals, and may provide greater accuracy, precision, and efficiency. Finally, the workshop will address the path toward global acceptance, validation, and implementation of scientifically valid alternative methods for acellular pertussis vaccines.
Draft Workshop Objectives
1. Review the usefulness and limitations for alternative *in vitro* test methods proposed to replace the current *in vivo* HIST
   - Review of *in vitro* protocols and data generated by participants of the pertussis toxin spiked vaccine study
     a. Use of a common set of vaccines, pertussis toxin (reference standard) and protocol for spiking
     b. *In vitro* assays tested
        i. Biochemical assays
           1. Binding assay: used to assess the amount of pertussis toxin/toxoid binding activity to the glycoprotein fetuin
           2. Enzymatic assay: monitors the residual ADP-ribosylation of the pertussis toxin/toxoid
        ii. Cell-based assays
           1. Human cells (PBMC) measuring ATP reduction
           2. Rat vascular smooth muscle cell line (A10) measuring cAMP
           3. CHO cell line (morphological/growth changes)
2. Discuss the application of these *in vitro* assays for monitoring consistency of vaccine manufacture as alternatives to the HIST
3. Establish a framework for international collaboration to achieve the adoption of *in vitro* assay(s) for acellular pertussis vaccine testing
4. Lay the groundwork for regulatory acceptance of a harmonized approach to *in vitro* assays as alternatives to the HIST
Draft Agenda
— Day 1 —
Wednesday, November 28, 2012

7:30-8:00 Registration and Poster Setup

8:00-8:20 Welcoming Remarks and Introduction to ICCVAM and ICATM Organizations
William S. Stokes, DVM; Assistant Surgeon General, USPHS; Director, NICEATM; Executive Director, ICCVAM
Karen Midthun, MD; Director, Center for Biologics Evaluation and Research (CBER), U.S. FDA

8:20-8:30 Workshop Overview and Objectives
Richard McFarland, PhD, MD, CBER, U.S. FDA

8:30 Opening Session
Co-chairs:
Juan Arciniega, DSc, CBER, U.S. FDA
Richard McFarland, PhD, MD, CBER, U.S. FDA

8:30-9:00 Plenary Presentation: The Many Faces of Pertussis Toxin
Nicholas Carbonetti, PhD, University of Maryland Medical School, USA

9:00-9:20 Current Regulatory Requirements for Residual Pertussis Toxin Testing of Acellular Vaccines
Sue Nelson, PhD, Sanofi Pasteur, Canada

9:20-9:40 2010 International Collaborative Study on Validation of an In Vitro Assay System as an Alternative to the Current Histamine Sensitization Test for Acellular Pertussis Vaccines
Dorothy Xing, PhD, National Institute for Biological Standards and Control (NIBSC), United Kingdom

9:40-10:00 Overview of the International Working Group for Alternatives to HIST (Phase 1)
Richard Isbrucker, PhD, Health Canada

10:00-10:20 Break

10:20-12:20 Session 1
Alternatives to HIST: Methods and Evaluations
Session 1A
Reports on Alternative Methods to HIST and Results Using Pertussis Toxin-Spiked Vaccine Samples
Co-chairs:
Sue Nelson, PhD, Sanofi Pasteur, Canada
Marieke Hoonakker, MSc, Netherlands Vaccine Institute, The Netherlands
Biochemical Assays: Carbohydrate-Binding Assay; Enzymatic/HPLC Assays

10:20-10:40 Analyses of Pertussis Toxin ADP-ribosyltransferase and Carbohydrate-Binding Activities as an In Vitro Alternative to the In Vivo HIST
   CT Yuen, PhD, NIBSC, United Kingdom

10:40-11:00 In Vitro Assays for the Detection of Pertussis Toxin: BSP114 Collaborative Study Results
   Amélie Castiaux, Ir, GlaxoSmithKline, Belgium

11:00-11:20 Alternative In Vitro Methods for Detection of Pertussis Toxin in Component Pertussis Vaccines: Results of a BSP114 Phase 1 International Collaborative Study
   Juthika Menon, PhD, Sanofi Pasteur, Canada

11:20-11:40 Characteristics of Enzymatic and Binding Activities of Pertussis Toxin According to Chemical Detoxifying Agents
   Hokyung Oh, PhD, Korea Food and Drug Administration, Republic of Korea

Biochemical and Cell-Based Assays:
Carbohydrate-Binding Assay, Enzymatic/HPLC Assays, CHO Cell Clustering Assay

11:40-12:00 Detection of PTx in Acellular Pertussis Vaccines Using a CHO Cell Clustering Assay, a Carbohydrate-Binding Assay, and an Enzymatic/HPLC Assay
   Richard Isbrucker, PhD, Health Canada

12:00-12:30 Cell-Based Assays for Detection of Pertussis Toxin in Acellular Vaccines: The Pertussis ATP Test (PAT) and the cAMP-PTx Assay
   Christina Bache, PhD, Paul-Ehrlich-Institut, Germany
   Marieke Hoonakker, MSc, Netherlands Vaccine Institute, The Netherlands

12:30-1:30 Lunch

Genetic Assays: Differential Gene Expression in Monocyte-Derived Dendritic Cells

1:30-1:55 Using Pertussis Toxin-Sensitive Genes in Dendritic Cells to Evaluate the Safety of Acellular Pertussis Vaccines
   Stefan F.C. Vaessen, PhD, University of Applied Sciences Utrecht, The Netherlands

1:55-2:20 Summary Analysis of Reported Data Sets
   Lev Sirota, PhD, CBER, U.S. FDA

2:20-5:00 Session 1B
   Alternative In Vitro Methods to the Murine Histamine Sensitization Test
   Co-chairs:
   Richard McFarland, PhD, MD, CBER, U.S. FDA
   Christina Bache, PhD, Paul-Ehrlich-Institut, Germany

   • Roundtable discussion of results and/or other available alternative methodsestrategies presented
**— Day 2 —**

**Thursday, November 29, 2012**
