About the OECD

The Organisation for Economic Co-operation and Development (OECD) is an intergovernmental organisation in which representatives of 31 industrialised countries in North and South America, Europe and the Asia and Pacific region, as well as the European Commission, meet to co-ordinate and harmonise policies, discuss issues of mutual concern, and work together to respond to international problems. Most of the OECD’s work is carried out by more than 200 specialised committees and working groups composed of member country delegates. Observers from several countries with special status at the OECD, and from interested international organisations, attend many of the OECD’s workshops and other meetings. Committees and working groups are served by the OECD Secretariat, located in Paris, France, which is organised into directorates and divisions.

The Environment, Health and Safety Division publishes free-of-charge documents in ten different series: Testing and Assessment; Good Laboratory Practice and Compliance Monitoring; Pesticides and Biocides; Risk Management; Harmonisation of Regulatory Oversight in Biotechnology; Safety of Novel Foods and Feeds; Chemical Accidents; Pollutant Release and Transfer Registers; Emission Scenario Documents; and Safety of Manufactured Nanomaterials. More information about the Environment, Health and Safety Programme and EHS publications is available on the OECD’s World Wide Web site (www.oecd.org/ehs/).

This publication was developed in the IOMC context. The contents do not necessarily reflect the views or stated policies of individual IOMC Participating Organizations.

The Inter-Organisation Programme for the Sound Management of Chemicals (IOMC) was established in 1995 following recommendations made by the 1992 UN Conference on Environment and Development to strengthen co-operation and increase international co-ordination in the field of chemical safety. The Participating Organisations are FAO, ILO, UNEP, UNIDO, UNITAR, WHO and OECD. The World Bank and UNDP are observers. The purpose of the IOMC is to promote co-ordination of the policies and activities pursued by the Participating Organisations, jointly or separately, to achieve the sound management of chemicals in relation to human health and the environment.
This publication is available electronically, at no charge.

FOREWORD

This document presents a short guidance on the Threshold Approach for Acute Fish Toxicity.

The project proposal was submitted by the European Commission to the OECD in 2006. The draft guidance document was circulated to the Working Group of the National Coordinators of the Test Guidelines Programme several times for comments in 2008 and 2009. The document was finally approved by the Working Group of the National Coordinators of the Test Guidelines Programme at its meeting held on 23-25 March 2010. The Joint Meeting of the Chemicals Committee and the Working Party on Chemicals, Pesticides and Biotechnology agreed to its declassification on 5 May 2010.

This document is published under the responsibility of the Joint Meeting of the Chemicals Committee and the Working Party on Chemicals, Pesticides and Biotechnology of the OECD.
THE THRESHOLD APPROACH FOR ACUTE FISH TOXICITY TESTING

General considerations

1. In the interest of animal welfare and efficient use of resources, it is important to avoid the unnecessary use of animals whenever possible. In the field of aquatic toxicology, this especially applies to the acute toxicity testing of fish according to OECD TG 203. The threshold approach described hereafter addresses fish toxicity by initially using a single-concentration test (limit test) requiring less fish compared to the full acute fish toxicity study. The selection of a single concentration is based on the derivation of a threshold concentration (TC) from reliable algae and acute invertebrate (e.g. daphnia) toxicity data. Fish toxicity is then tested at the TC to consider if fish are more or less sensitive than groups/species for which an E/LC₅₀ is available. If no mortality occurs in the limit test using the TC, the TC might be used as a surrogate of the LC₅₀ value in the further hazard or risk assessment.

2. The threshold approach proposes good practice for in vivo testing for acute fish toxicity. The threshold approach is based on the observation that fish is not always the most sensitive test species (1, 2). The concept initially described for pharmaceuticals (2) was further developed for chemical substances at the European Commission’s Joint Research Centre (3) taking into consideration the requirements of the limit test in OECD TG 203 (4, 5). In addition, several publications confirm the potential of the threshold approach in reducing the number of fish for acute toxicity testing (6, 7), also when applied to other substances than chemicals.

3. The threshold approach provides a concentration-response relationship allowing a precise LC₅₀ derivation if fish is the most sensitive group of test organism after short-term exposure (see 7).

Description of the threshold approach

4. When acute fish toxicity data need to be generated, this guidance document recommends that the threshold approach should be applied whenever possible. The whole approach might include the performance of tests in a step-wise manner according to the following OECD Guidelines:

- TG 201 – Freshwater Alga and Cyanobacteria, Growth Inhibition Test
- TG 202 – Daphnia sp. Acute Immobilisation Test
- TG 203 – Fish, Acute Toxicity Test (Limit test, paragraph 20)

\(^1\) Incorporated into the “Guidance on information requirements and chemical safety assessment” for REACH. See: ECHA (2008). Guidance on information requirements and chemical safety assessment. Chapter R.7B – Endpoint specific guidance (p. 41 ff, Chapter 7.8)
• TG 203 – Fish, Acute Toxicity Test.

5. It is recommended that the following step-wise procedure should be utilized (Figure):

6. Derivation of the threshold concentration (Step 1 - 3): The lowest EC50 value of existing and reliable algae or acute invertebrate (e.g. daphnia) toxicity data is set as threshold concentration (TC). If these data are not available they need to be determined according to OECD TG 201 and OECD TG 202 or any other standard test method generating reliable data.

7. Assessment of acute fish toxicity (limit test) at the TC (Step 4): An acute fish test is performed according to the limit test (OECD TG 203, paragraph 20) at the TC. If the TC is >100 mg/l, the test substance concentration should be 100 mg/l in the limit test. The absence of mortality at a TC<100mg/L indicates that the fish is not the most sensitive group of test organism after short-term exposure and that, with at least 99% of confidence, the LC50 is greater than the TC. If sublethal effects are observed, these should be recorded. The test should be terminated when one or more fish from the test group die, since this finding requires a full study (step 5). In compliance with the OECD Guidance Document on the recognition, assessment, and use of clinical signs as humane endpoints for experimental animals used in safety evaluation (8), the remaining fish should be humanely killed.

8. Performance of a full OECD TG 203 (Step 5): If mortality is observed in the limit test using the TC, a full OECD TG 203 study should be conducted.
