

NTP Nonneoplastic Lesion Atlas

Ovary, Epithelium – Hyperplasia

Figure Legend: **Figure 1** Ovary, Epithelium - Hyperplasia, in a female F344/N rat from a chronic study. There is proliferation of the surface epithelium of the ovary. **Figure 2** Ovary, Epithelium - Hyperplasia in a female F344/N rat from a chronic study (higher magnification of Figure 1). There is proliferation of the surface epithelium of the ovary.

Comment: Proliferation of the epithelium lining the surface of the ovary appears as small polypoid projections from the epithelial surface and as downgrowths of cords of cuboidal epithelium cells with basophilic cytoplasm (Figure 1 and Figure 2). Epithelial cell hyperplasia is thought to be derived from the mesothelium lining the ovarian surface. In the past, this has been referred to as germinal epithelium but the term “germinal epithelium” is misleading, because the epithelium covering the surface of the ovary is a continuation of the peritoneum. Epithelial cell hyperplasia must be distinguished from adenoma, cystadenoma, and tubulostromal neoplasms and from tubular (Sertoliform) hyperplasia, which consists of tubules lined by columnar cells with indistinct cytoplasmic borders and basal nuclei.

Recommendation: Ovary, Epithelium - Hyperplasia should always be diagnosed and given a severity grade.
