

Strategic Realignment: Translational Toxicology

Presenter: Dr. Brian Berridge, NIEHS/DNTP

The National Toxicology Program is continuously building on a history of relevance, excellence, and impact. Maintaining that history and leading an evolution in the way toxicology is applied to protect public health will require fundamental shifts in our approaches and likely a refinement in our organizational structure. We're defining those shifts and refinements now. This presentation will share a few principles guiding our discussions and provide a conceptual framework for how subsequent presentations during this meeting will illustrate current and future applications of those principles.

Following presentation of the examples from NTP's portfolio, the BSC will be asked to provide perspective for NTP regarding the strategic realignment, specifically, with regard to:

- Contemporary issues in toxicology, environmental and pharmaceutical safety, and risk assessment.
- Technological or scientific advances that should be leveraged.
- Effective communication approaches and products.
