U.S. FOOD & DRUG ADMINISTRATION

Evaluating Cardiotoxicity Potential:

Translational Approaches and Models

William B Mattes, PhD, DABT

Director, Division of Systems Biology

National Center for Toxicological Research

Jefferson, AR

U.S. FOOD & DRUG ADMINISTRATION

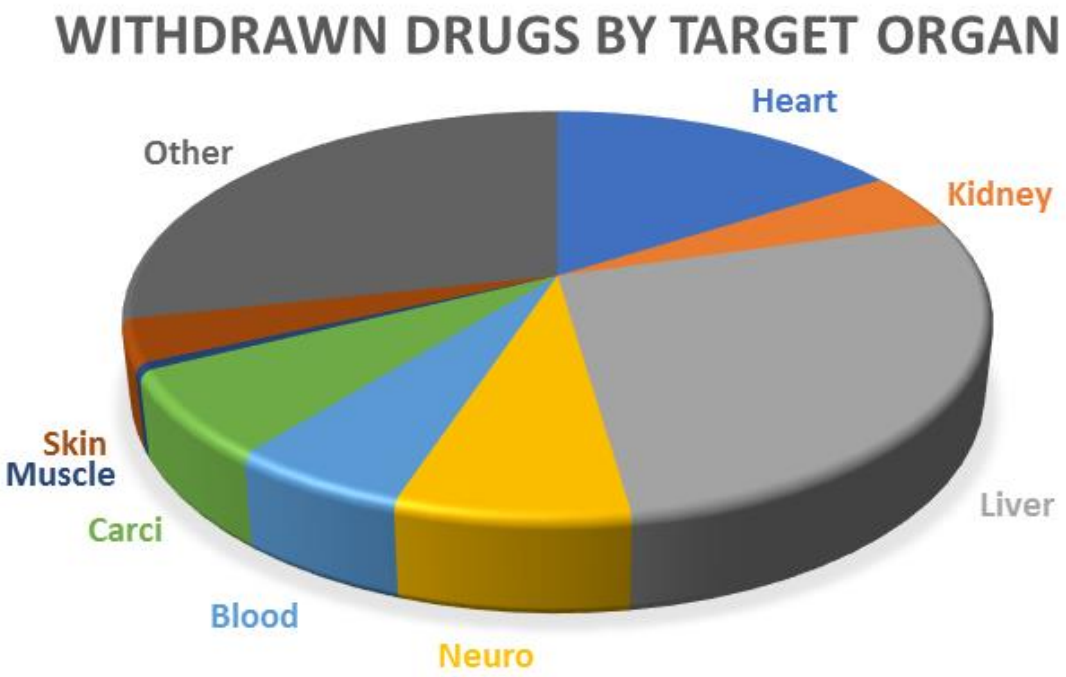
Cardiotoxicity



Data from Wikipedia

"List of Withdrawn Drugs" - 1979-2011

Cardiotoxicity is a concern for drug development and environmental chemicals

Cardiotoxic Agents

- Anticancer drugs
- Antiretroviral agents
- Antidiabetic drugs
- Cocaine
- Ethanol
- Metamphetamines
- Carbon monoxide
- Metals
  - Lead
  - Cobalt
- Venoms / Toxins

Mechanisms of toxic cardiomyopathy

Hantson, P. (2018). Clinical Toxicology **57:** 1-9

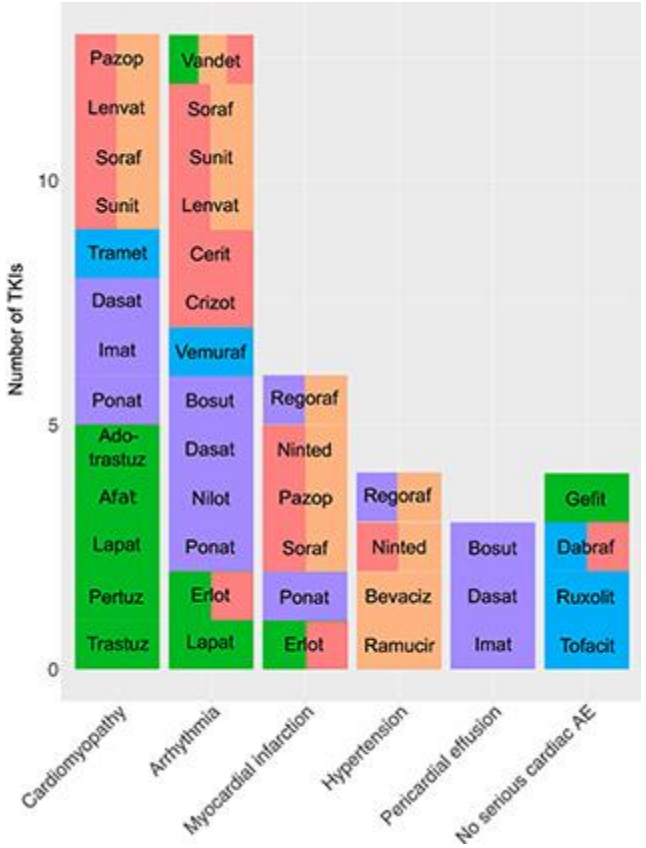
Cobalt Cardiomyopathy
A Critical Reappraisal in Light of a Recent Resurgence

Packer, M. (2016). Circulation: Heart Failure **9**:e003604

Low-level lead exposure and mortality in US adults: a population-based cohort study

Lanphear, BP. (2018). Lancet Public Health **3**: e177–84

Cardiotoxicity - Manifestations



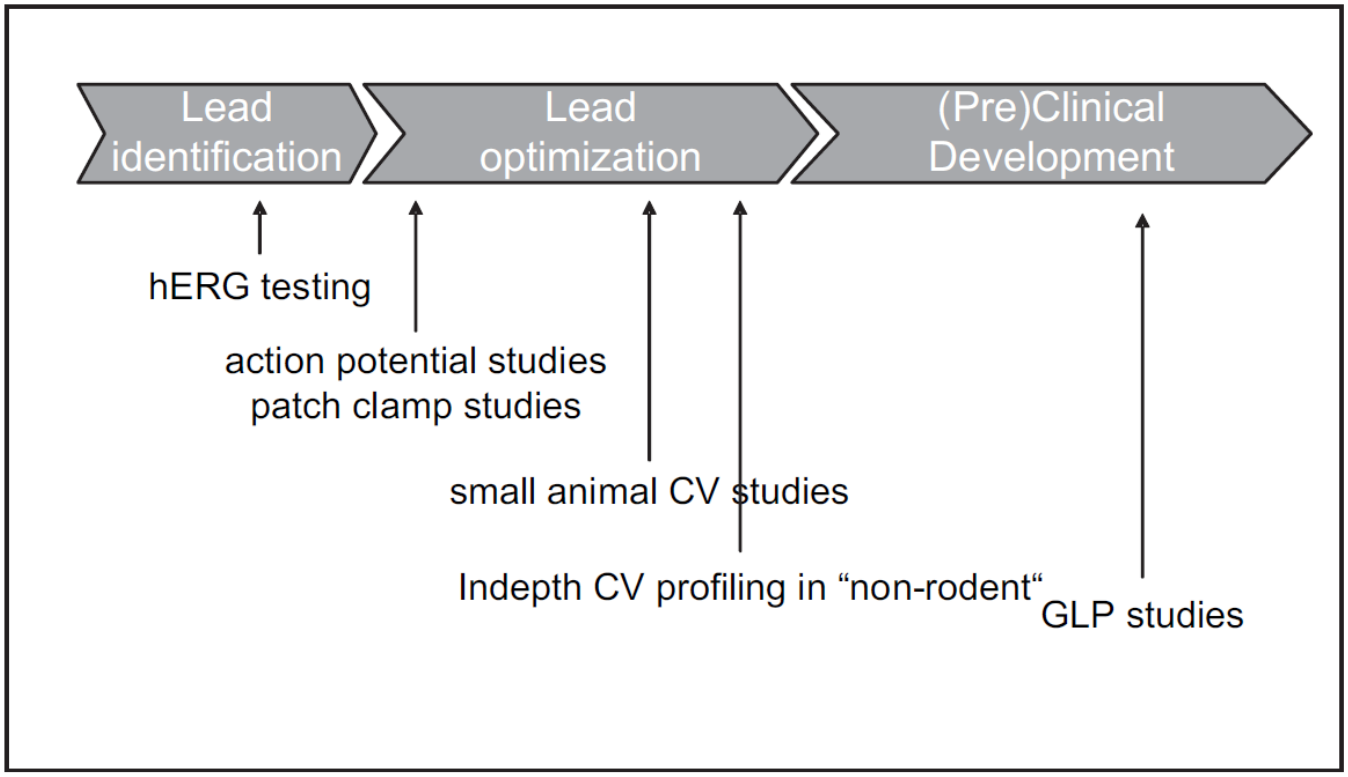
Shim, J. V., et al. (2017). Front Physiol **8:** 651.

Adverse Events Elicited by Tyrosine Kinase Inhibitors

- Cardiomyopathy
  - cardiac dysfunction
  - congestive heart failure
  - left ventricular dysfunction
  - cardiomyopathy
- Arrhythmia
  - prolonged QT interval
  - cardiac bradyarrhythmia
  - cardiac arrhythmia
- Myocardial infarction
- Hypertension
- Pericardial effusion
  - pericardial/pleural effusion
  - cardiac tamponade
- Hypertrophy

Cardiotoxicity Assessment

Drug Development Safety Pharmacology Studies
For Cardiovascular Liabilities

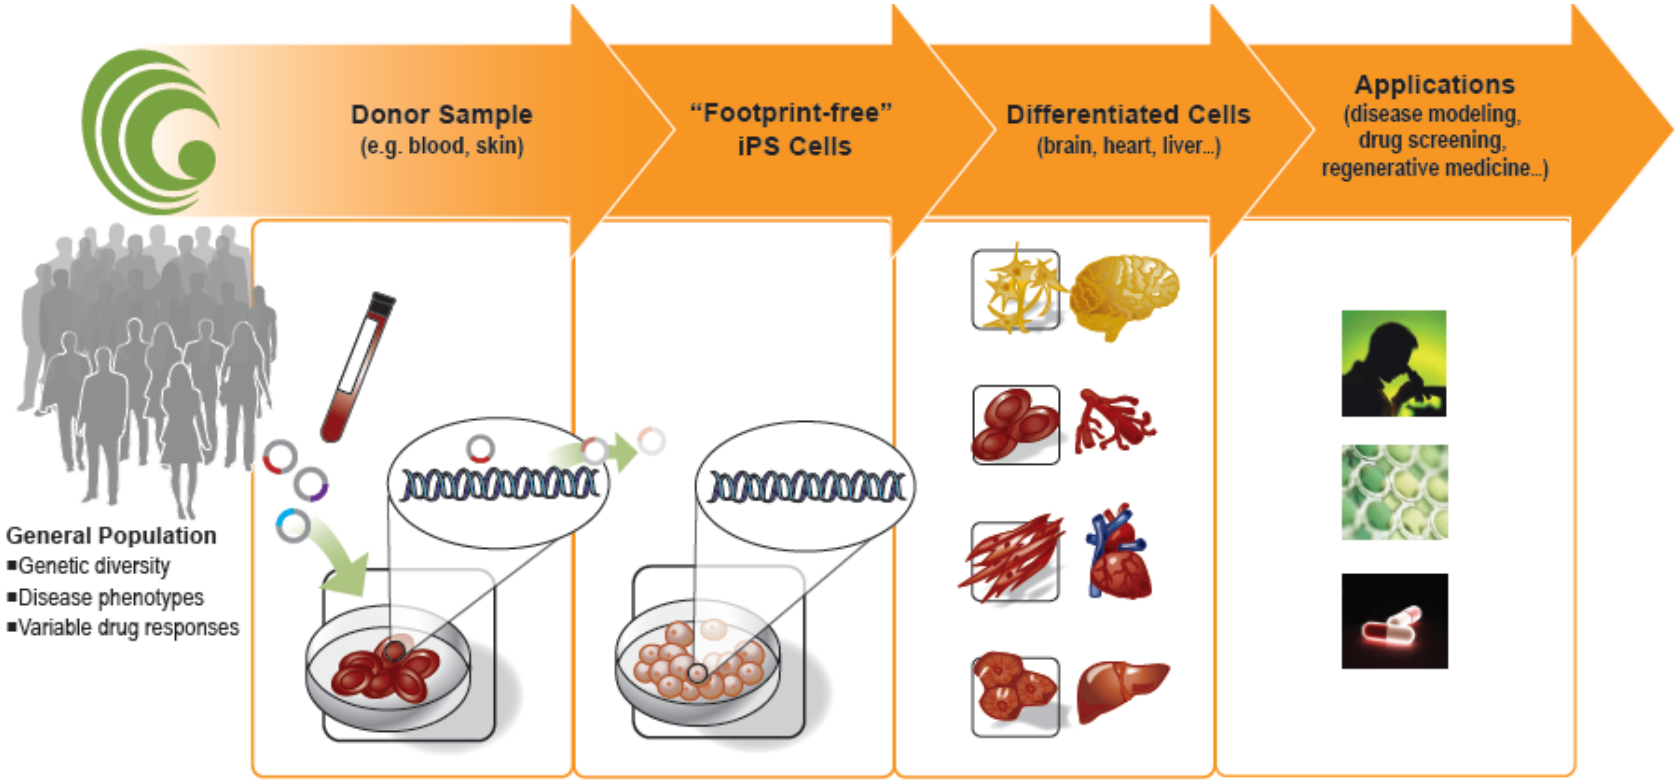


Guth, B. D. (2007). Toxicol Sci **97: 4-20.**

New *in vitro* Tools and Approaches

- “Cardiomyocytes” from induced pluripotent stem cells from human donors: iPSC-CMs
- Noninvasive electrical activity monitoring: Impedance assay and multi-electrode array
- High throughput Ca^{2+} flux assays

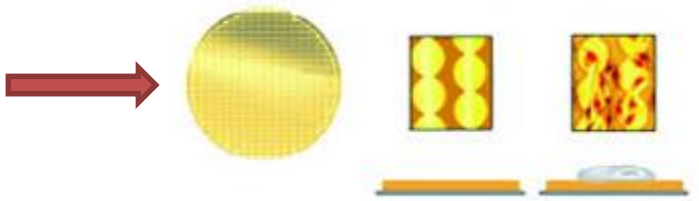
Derivation of human iPSC-CMs



From: "CDI: Providing True Human Biology in a Dish" DS-CDI17025 © 2017 CDI, Inc

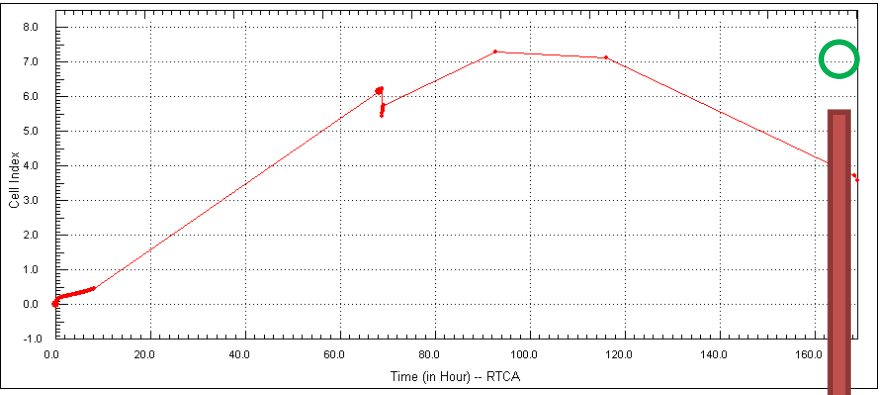
Non-invasive Impedance Assay

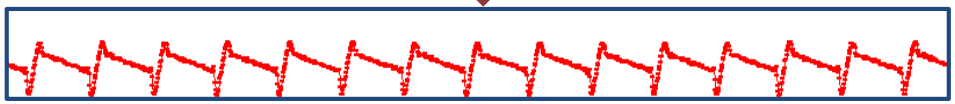
96-well



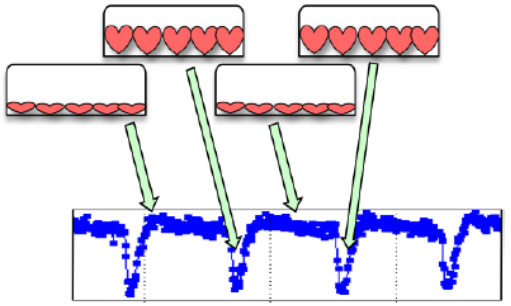
Real-time, label-free

- Morphology
- Cell-cell contact
- Adhesion





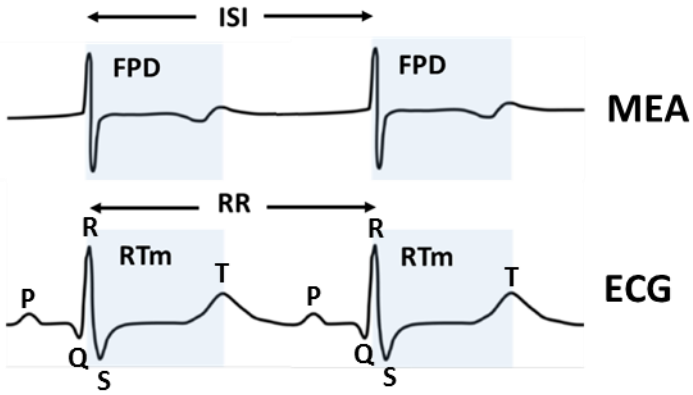
Contraction

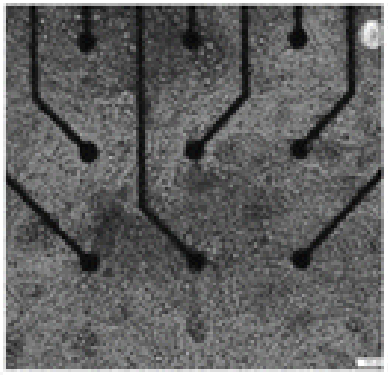


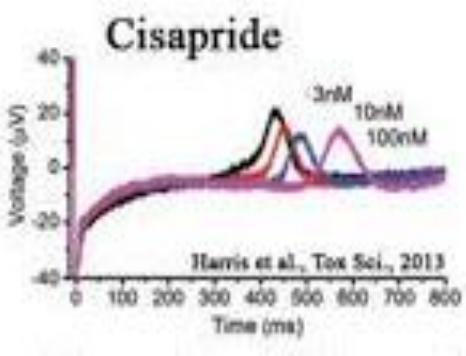
Sensitivity: Morphology change 1nm

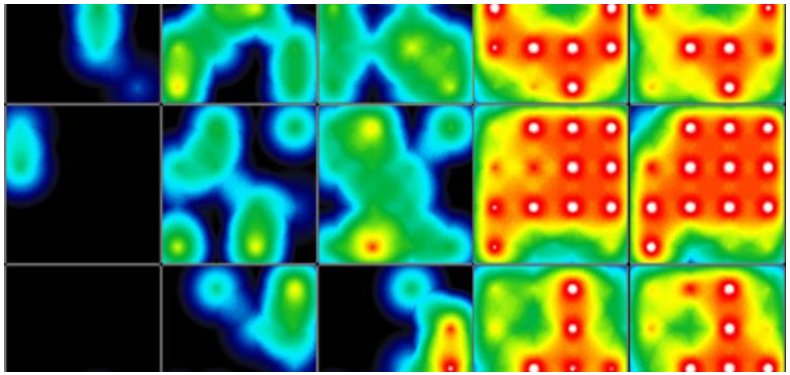
(Cell membrane 3nm; Light microscopy ~250 nm)

Micro-electrode Array (MEA)

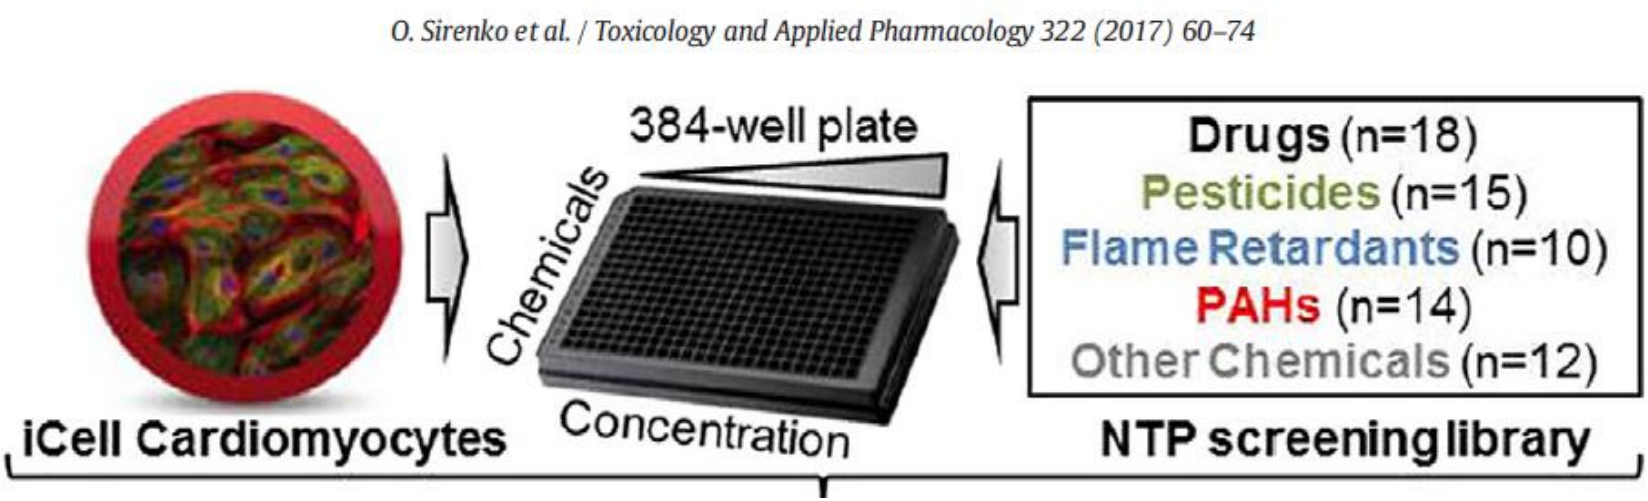








High-Throughput Screening



- 30’ / 24 hr time points
- Ca2+ flux measurements
- high-content imaging

Changing Qt Studies

The new CIPA paradigm will be driven by a suite of mechanistically based in vitro assays coupled to in silico reconstructions of cellular cardiac electrophysiologic activity, with verification of completeness through comparison of predicted and observed responses in human-derived cardiac myocytes.

What's Not To Like?

Acute (contractile) vs Chronic (structural) effects?

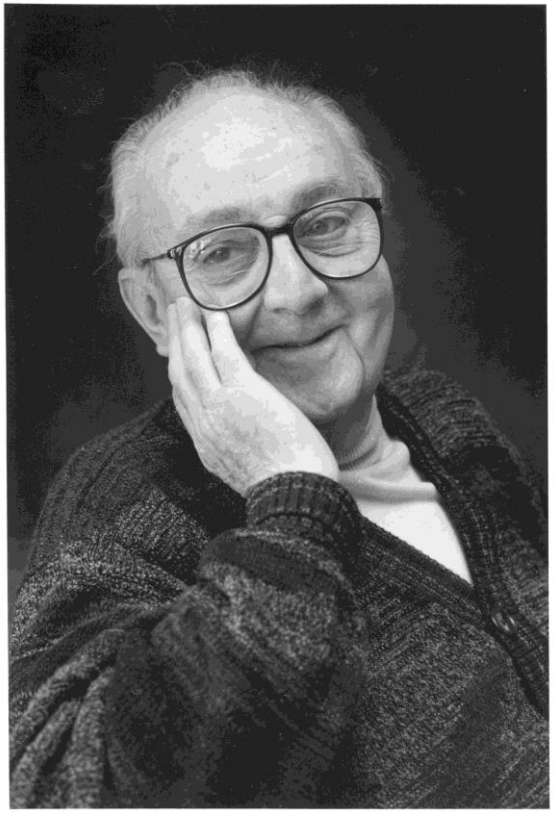
"However, QT prolongation and other arrhythmias are only one part of the iceberg, as they account for 23% and 4% of the cardiovascular issues, respectively. Therefore, to increase the likelihood of success, an effective de-risking strategy should not solely cover proarrhythmia liability, but also integrate hemodynamic and cardiac contractility assessment, and address both functional and structural aspects of cardiotoxicity."

- Atienzar, F., et al. (2016). Journal of Medicines Development Sciences **2:** 2

Basic Principle 1

All models are wrong;
some models are useful.

-George E. P. Box



Model Improvement

- Can an *in vitro* system model chronic / structural type cardiotoxicity?
- What is the impact of different donors on cardiotoxicity?
- What impact do assay conditions have on results?
- How can an *in vitro* approach be informed from *in vivo* and clinical data*?*

How well do current iPSC-CMs model KI-induced cardiotoxicity? Are longer exposures more informative?

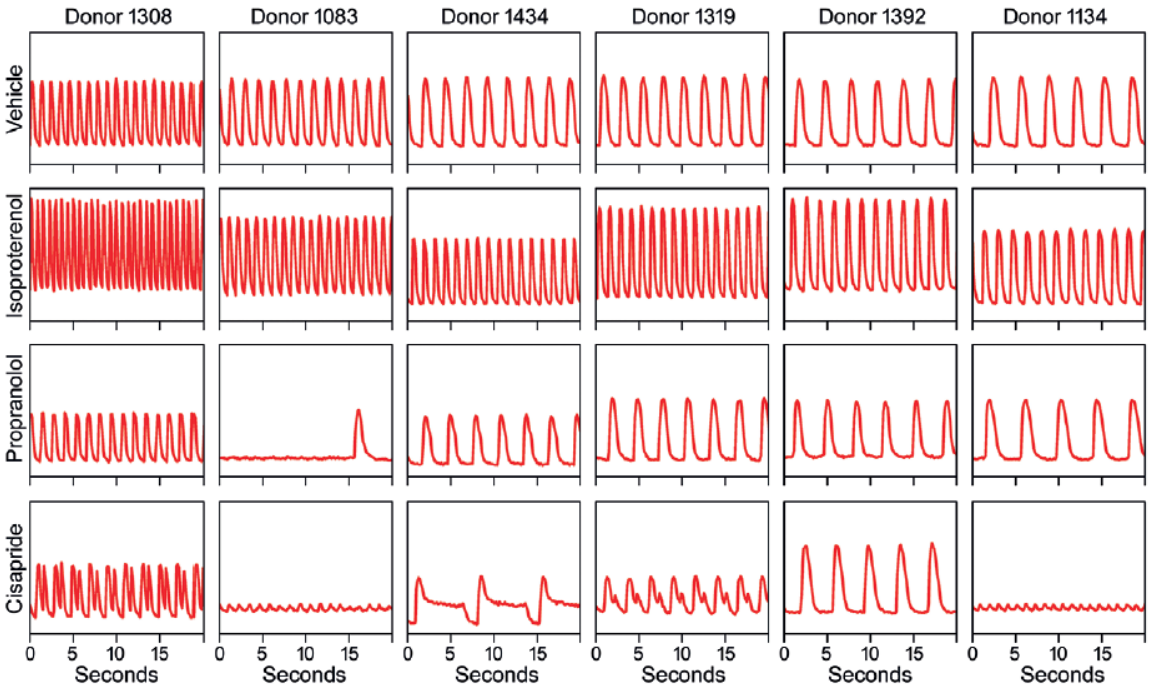
Impact of Donor on Derived iPSC-CM

Ca^{++} Flux Traces for Cells Derived from 6 Donors



iPSC-CMs:
27 healthy donors

"The degree of inter-individual variability in responses to treatment is reproducible, and depends on the chemical and phenotypic endpoint"

Grimm, F. A., et al. (2018). Altex **35:** 441-452.

Patient-specific iPSC-CMs

Medical College of Wisconsin and Cellular Dynamics Awarded NHLBI Grant Using Human Induced Pluripotent Stem Cells

Download PDF

CDI Will Generate 250 Stem Cell Lines and Differentiate Them into Heart Cells to Investigate Mechanisms Underlying High Blood Pressure

HyperGEN – NHLBI Family Blood Pressure Program:

- African-American and Caucasian Cohort
- Phenotyping: Cardiovascular phenotypes and risk factors
- Family-based ascertainment
- GWAS performed in families
- WES data available + iPSC WGS grant submitted
- Generated from a peripheral blood sample
- Differentiated and cryopreserved
- Tested for pluripotency and chromosomal integrity

Impact Of Donor Variability On KI-induced Cardiotoxicity

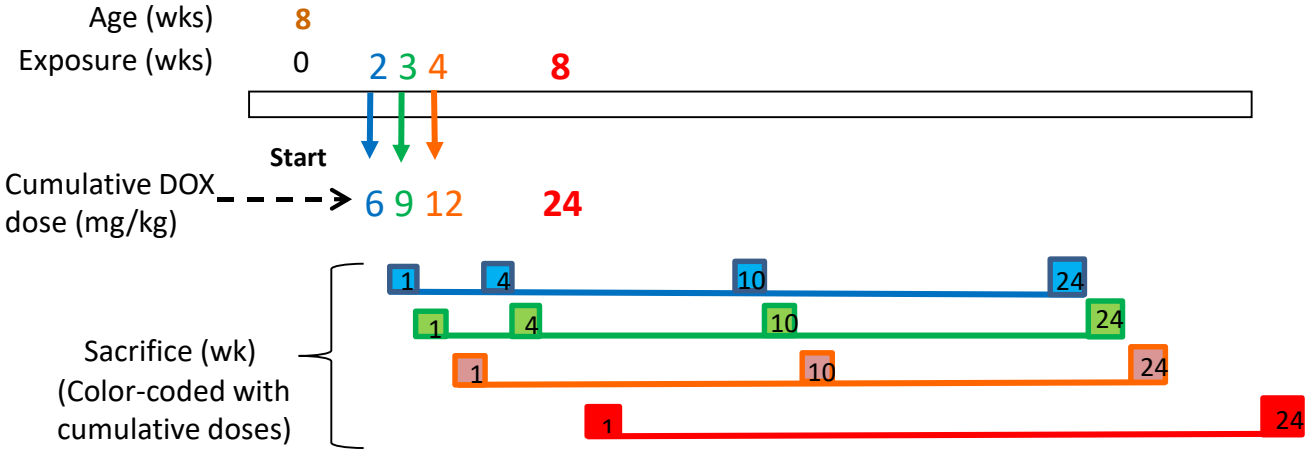
Plasma protein measurements performed using aptamer-based technology by SOMALogic, Inc. **False Discovery Rate <0.1**

Mouse Model of Delayed-onset Cardiotoxicity

Study design

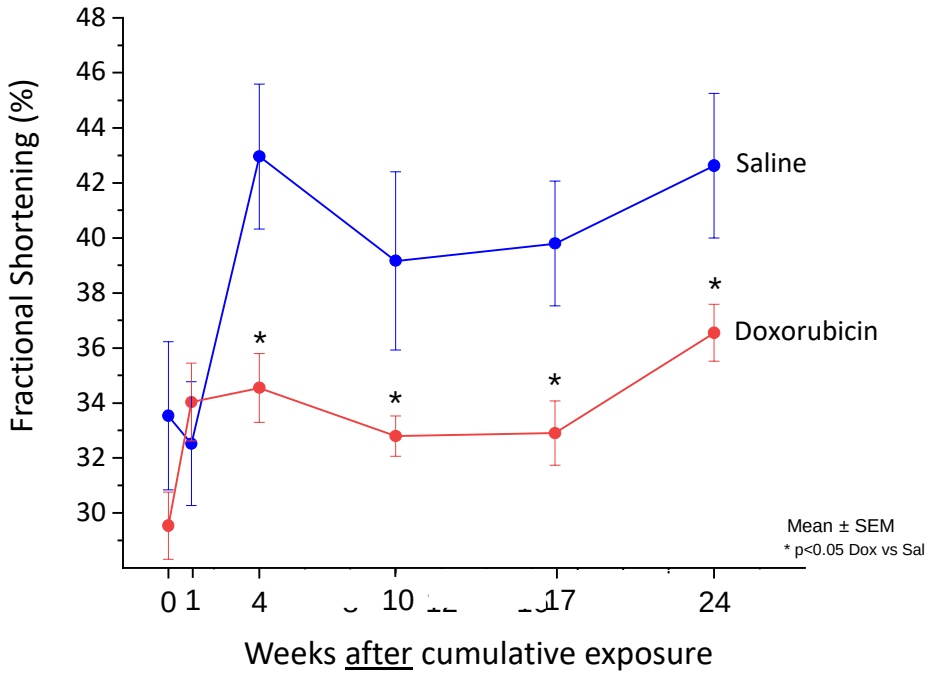
Animals:	Male B6C3F$_1$ mice
Treatment:	Doxorubicin or saline (i.v.)
Dose:	3 mg/kg body wt./week
Sacrifice:	1-, 4-, 10-, 24-week after each cumulative dose



Mouse Model of Delayed-onset Cardiotoxicity

Left Ventricular Fractional Shortening (FS)

24 mg/kg cumulative doxorubicin dose#

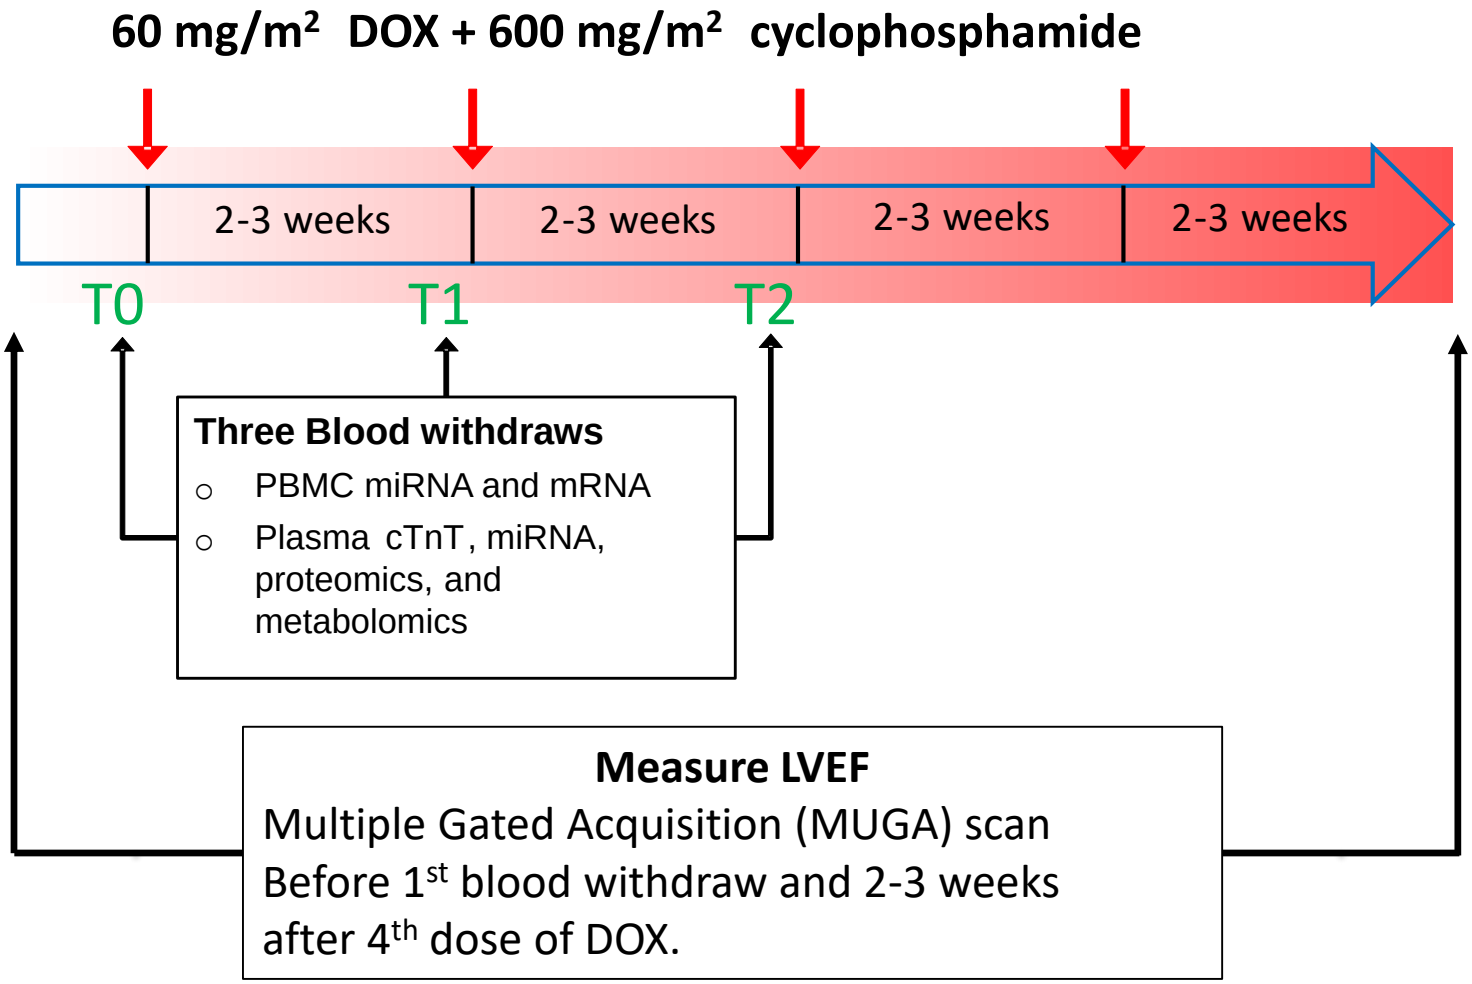


~14- 20% decline in FS at 4 -24 wk after the end of Dox treatment

71 mg/m^2 HED

Clinical Cardiotoxicity

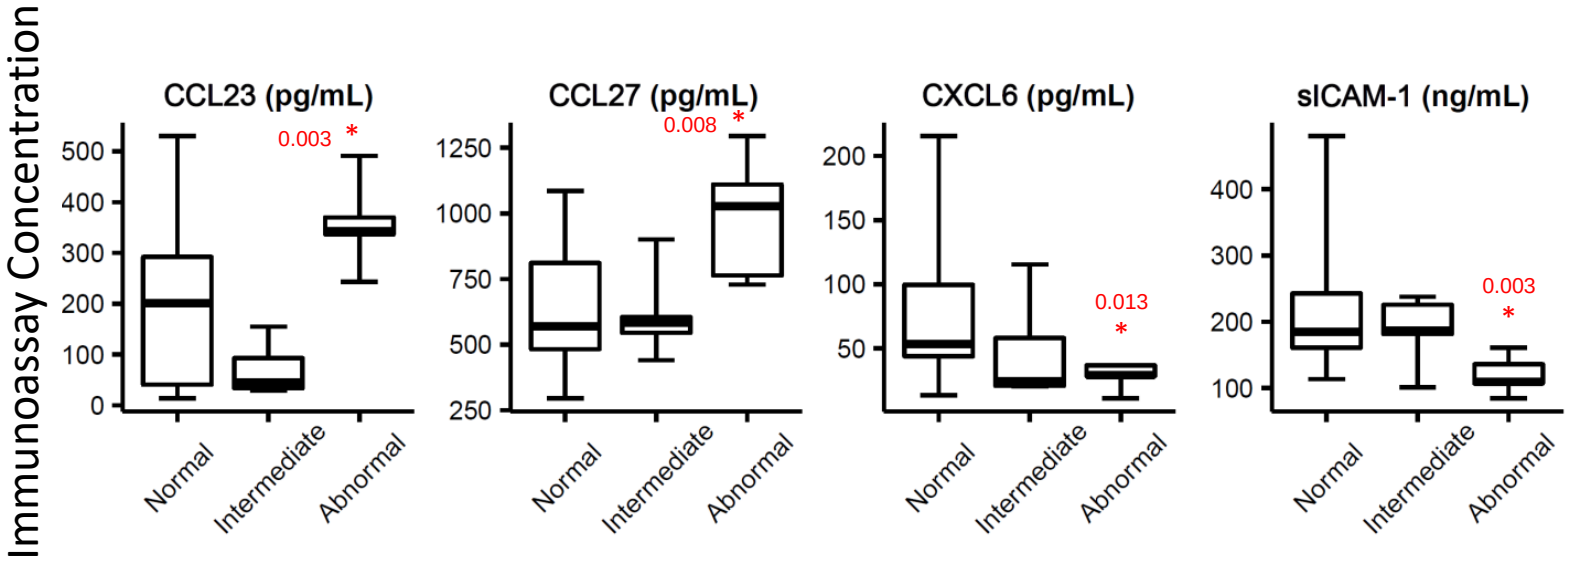
100 breast cancer patients receiving doxorubicin



This study was approved by RIHSC

Clinical Cardiotoxicity

Differential Plasma Levels of Proteins in the Patient Groups before DOX Treatment (T0)



Next Steps

- Correlate *in vivo* with clinical endpoints
  - Protein / metabolomic biomarkers
- Examine *in vitro* model for correlative biomarkers
  - E.g. miRNA, metabolomic

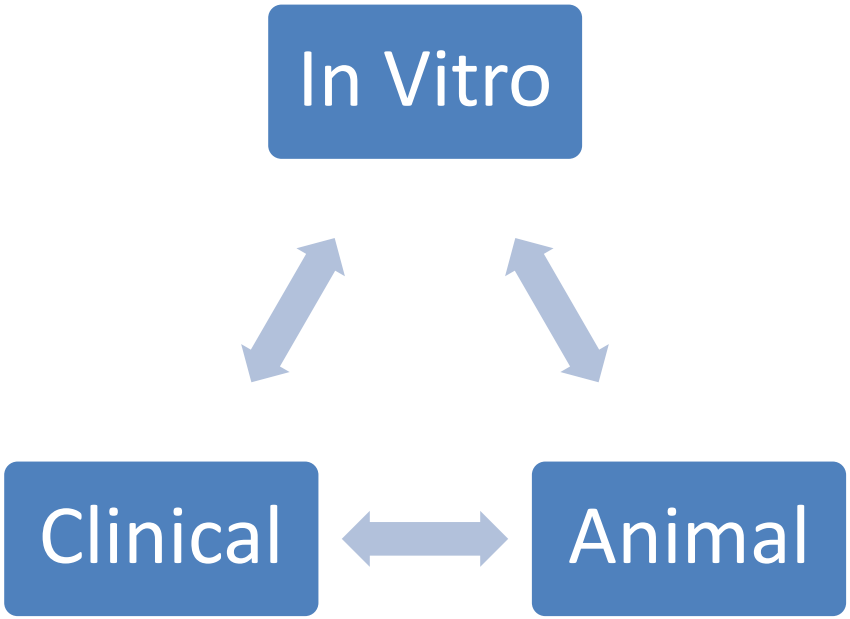
One Tool by Itself

A great melody, but….

More Tools, Harmonized

Has greater impact with the whole band …

Translational Systems Biology



- Connect non-clinical studies with clinical investigations
  - Mechanism
  - Biomarkers
- Improve safety assessment tools
- Broaden the utility of *in vitro* screens
- An ongoing effort
