Other Outcomes that Did Not Reach Hazard Conclusions

Inadequate evidence to determine whether there is an association with acute sarin exposure for the following outcomes:

- Sleep Disruption
- Anxiety and Fear
- Avoidance and Depression
- Activity and Strength
- Other Neurological Symptoms
- Electroencephalogram (EEG) Data
- Other Sensory Effects

Confidence Ratings Considered

- Low, very low, or single studies reporting no evidence of effects
- No data for some time periods
- High heterogeneity due to different endpoints measured
- Very serious risk of bias concerns
