Subject: Peer Review of the Draft NTP Technical Reports on Cell Phone Radiofrequency Radiation March 26-28, 2018

Comment:

I think that a research interestingly similar to yours was the large scale study on rats reported in: Chou CK, Guy AW, Kunz LL, Johnson RB, Crowley JJ, et al., 1992. Long-term, low-level microwave irradiation of rats. *Bioelectromagnetics* 1992; **13**: 469–96

The last line of table 2 there shows increased cancer risks in rats exposed to RF radiation.

Is it possible to include discussion of carcinogenicity results from the two studies? Does the new study confirm the carcinogenicity indicated in Chou et al? Why were the types of cancers in the two studies different?
