Qualification

Adoption &
Implementation

The NAMs Confidence Continuum:
from *Research* to *Validation/Qualification* to
Adoption & Implementation

NICEATM Scientific Tools

NIH Integrated Chemical Environment (NICE)

NICE is an open-access, user-friendly platform developed by NICEATM that provides curated toxicologically relevant data and interactive computational tools to support development and evaluation of new testing approaches.

Open (Quantitative) Structure-activity/property Relationship App (OPERA)

OPERA is a free and open-source/open-data suite of QSAR models providing predictions for physicochemical properties, environmental fate parameters, and toxicity endpoints to support non-animal approaches for predicting toxicity.

Modeling and Visualization (MoVIZ) Pipeline

MoVIZ is a cheminformatics pipeline developed using the free and open-source KNIME analytics platform and aims to democratize computational methods through intuitive, well-documented, and user-friendly graphical interfaces. Among MoVIZ tools is a workflow facilitating chemical grouping based on supervised and unsupervised machine learning approaches.

Collection of Alternative Methods for Regulatory Application (CAMERA)

CAMERA is an interactive database and user interface providing online access to validation alternative methods for regulatory and other contexts of use. Users can access validation study reports, data, protocols/SOPs, and information on regulatory guidance.

The DASS App

The DASS App is an open-source web application to predict skin sensitization using defined approaches. It enables users to apply validated non-animal approaches to their own data.

The Skin Sensitization Risk Assessment – Integrated Chemical Environment

SARA-ICE is an open access web tool for quantitative prediction of a chemical's potential to cause skin sensitization in humans. It uses a Bayesian statistical model developed by NICEATM and Unilever to estimate human-relevant metric of skin sensitizer potency.

The HPPT App

The HPPT App is an open-source web application that helps classify human predictive patch test (HPPT) data for skin sensitization potency using a WoE approach. It enables users to apply a GHS based approach for assigning skin sensitization potency subcategorizations to their own data.

OHT 201
Chemical + Assay
Record

TABLE 2 Examples of the translation between the Mechanistic Target annotation terms and OHT 201 *Process* and *Object* fields. *Process* and *Object* fields are intended to describe the mechanism that can be measured using the assay. At the time of publication, some of the selected terms were not part of the template picklist. Blank spaces indicate that a term was not selected.

Mechanistic target term	OHT 201 <i>Process</i> term*	OHT 201 <i>Object</i> term*
Energy homeostasis	Energy homeostasis	Cell morphology
Extracellular matrix organization	Extracellular matrix organization	Matrix metalloproteinase
Neural precursor cell proliferation	Cell proliferation	
p53 signaling pathway	Signaling	p53 protein
Regulation of angiogenesis	Regulation of angiogenesis	Vascular cell adhesion protein 1
Thyroxine deiodinase activity	Enzyme activity	Type III thyroxine deiodinase

*These terms may or may not be included in the current inventory of the pick-list. Our research supports diversifying the inventory of available terms; thus, these standardized fields may be subject to future refinement.

Hill et al., 2026, *Front. Toxic.*

DTT/NIEHS Screening Efforts in a Battery of DNT In Vitro Assays

Hall et al., 2026, Neurotox.

Prioritizing chemicals for developmental neurotoxicity by integrating data from a new approach methods (NAMs) battery covering key cellular events in neurodevelopment

Laura A. Hall^a, Jui-Hua Hsieh^b, Skylar W. Marvel^b, Mamta Behl^{c,d}, Ellen Fritsche^e, Katharina Koch^f, Anna Kreutz^g, Marcel Leist^h, Arantza Murianaⁱ, Timothy J. Shafer^j, Jason P. Stanko^a, Robert C. Sills^k, Helena T. Hogberg^l, Christopher A. McPherson^{m,*}

87.8% of in vivo actives also active in vitro

In Vitro to In Vivo Extrapolation (IVIVE)

A Comparison of PBK Models

- Developed a DNT-IVIVE approach linking in vitro concentrations to human-equivalent doses across brain development
- Transferred the approach across PBK platforms, with expected differences due to lipophilicity and partitioning methods
- Confirmed strong concordance between DNT-IVIVE estimates and *in vivo* observations

Toxicological Sciences, 2026, 209(2), kfaf147
<https://doi.org/10.1093/toxsci/kfaf147>
Advance Access Publication Date: October 27, 2025
Research article

Comparison of physiologically based pharmacokinetic modeling platforms for developmental neurotoxicity in vitro to in vivo extrapolation

Anna Kreutz ^{1,*}, Xiaoqing Chang ¹, Michael Lawless², Susana Proença ³, Stephan Schaller ³, Nicole Kleinstreuer ^{4,5}, Helena T. Hogberg ⁴

Kreutz et al., 2026, Tox Sci.

DNT-IVIVE for the DTT/NIEHS Screening Battery

- Expanded DNT-IVIVE to chemicals from the Phase 1 screen
- Adapted the approach for zebrafish behavioral assays using a zebrafish PBPK model
- Integrated cell-based, zebrafish, and human dose estimates for cross-species risk assessment
- Flagged priority chemicals with overlapping human exposures and DNT activity concentrations, indicating potential health concerns

Kreutz et al., manuscript in prep

Moving DNT Forward

Incorporation of Lactational Exposure

- Develop a lactational PBPK model that includes a maternal breast compartment
- In vitro to in vivo extrapolation (IVIVE) approach to reduce uncertainties in DNT risk assessment for infants

A Data-driven Approach to Prioritizing Assays

- Proof-of-concept, develop a conditional generative adversarial network (cGAN) applied to subset of assays
- Expand to the whole battery

Predicting Chemical Distribution

Brain-Adipose PBK Model

- Built upon generic PBK model from EPA's htk R package (v2.2.2)
- Addition of brain and adipose compartments
- Diffusion-Limited brain compartment considering blood brain barrier permeability
- Evaluated to in vivo data for adipose, brain, and plasma concentrations

Log10 Predicted vs Observed Adipose

Log10 Predicted vs Observed Brain

Zebrafish PBK Model

- Provides pharmacokinetic predictions for 10 organs and experimental compartments
- Incorporates developmental changes and metabolism
- Model revised to several hundred chemicals

Kreutz et al.,
manuscript in prep

Systematic Evaluation of the Application of Zebrafish in Toxicology (SEAZIT)

- An interlaboratory case study with vehicle and positive controls to understand the landscape of variability among phenotype assessment terms and varying experimental protocols
- While laboratories differed in responses, there were two consistent observations:
 - 1) Renewing media daily increased potency of positive control across many phenotypes
 - 2) Head defects were noted to be a sensitive endpoint for both controls
- Data can be explored through the SEAZIT-DIVER Tool: <https://seazit.dtt.niehs.nih.gov/seazit/>

Hill et al.,
manuscript in
prep

Mean positive control response (benchmark concentrations, $\mu\text{M} \pm$ standard error) across harmonized assessment terms

S = static media protocol (no media replacement)
 SR = static renewal media protocol (daily replacement of chemical media)
 * statistical difference between protocol

Validation/Qualification Support (1)

Electrophilic Allergen Screening Assay

Electrophilic Allergen Screening Assay (EASA)

The EASA is a chemical assay that measures a chemical's tendency to bind to proteins, the first step in skin sensitization. [Read More »](#)

The Skin Allergy Risk Assessment (SARA) – ICE Model

A SARA-ICE is a Bayesian statistical model which infers a human-relevant metric of sensitiser potency (termed ED_{01}), the dose with a 1% chance of human skin sensitisation.

- Utilises any combination of human repeat insult patch test (HRIPT), LLNA, direct peptide reactivity assay (DPRA), KeratinoSens™, h-CLAT™, U-SENS data – looking to add more inputs to the extended database this year, please contact NICEATM for details
- Derive a Point-of-departure for use in risk assessment (geometric mean)
- Included in OECD Test Guideline 497 – Defined Approaches for Skin Sensitisation <https://doi.org/10.1787/b92879a4-en>
- Application of SARA-ICE to agency partner dataset published January 2026 <https://doi.org/10.1016/j.namjnl.2026.100078>

Regulatory Application: US EPA used SARA-ICE in a human hazard assessment for phthalic anhydride

PUBLIC RELEASE DRAFT
March 2026

1936 2013), 1 h-CLAT assay (Nakada et al., 2012), and 3 LLNAs (Plimack et al., 2003; Dearman et al., 2000;
1937 Basketter and Scholes, 1992) were included in the quantitative SARA-ICE evaluation (Table 4-11).
1938
1939

Table 4-11. Summary of Phthalic Anhydride Data Included in the SARA-ICE Model

KE 1		KE 2		KE 3		KE 4
DPRA (% Depletion)	hDPRA (M ⁻¹ s ⁻¹)	KeratinoSens EC _{0.1} (μM)	IC ₅₀ (μM)	h-CLAT CD54, EC _{0.1} (μg/mL)	CD86, EC _{0.1} (μg/mL)	CV ₇₀ (μg/mL)
Cysteine Lysine						
1.9 ^a	75 ^a	~0.67 ^b	>2,000 ^c	>2,000 ^c	>400 ^d	>400 ^d
						0.16 ^e ~1.5 ^f ~2.5 ^g

Abbreviations: DPRA = Direct Peptide Reactivity Assay; h-CLAT = Human Cell Line Activation Test; hDPRA = Kinetic DPRA; KE = Key event; LLNA = local lymph node assay; NR = Not reported; CV₇₀ = the estimated concentration showing 70% viability

^a (Gerberick et al., 2004)
^b (Vareine et al., 2017)
^c (Nakada et al., 2012)
^d (Dearman et al., 2000)
^e (Plimack et al., 2003)
^f (Basketter and Scholes, 1992)
^g (Cisicki et al., 2013)

1940 The SARA-ICE model can run an infinite number of samples to estimate the ED₀₁; however, for
1941 efficiency, a default of 10,000 samples is used to make the estimates. Repeat runs of the model will have
1942 slight variation but will not change overall. EPA ran the SARA-ICE model using two separate sets of
1943 input data. The first one included all data in Table 4-11. The second dataset excluded all h-CLAT and
1944

Updates to Guidance Document 34

New Sections and Guidance on Validation Process

- Revisions to Chapter 3 and Chapter 4 provide better guidance on types of validation covered and using a validation workflow
 - Adds defined approaches and increased coverage of in silico methodologies
- Development of readiness criteria covers the “requirements” for a methodology to advance in the workflow
- New guidance around quality processes

ID: EPA-HQ-OPP-2016-0093-0090
Title: [Interim Science Policy: Use of Alternative Approaches for Skin Sensitization as a Replacement for Laboratory Animal Testing Draft for Public Comment](#)
Description: Consistent with OCSPP's commitment to advancing the implementation of NAMs in human health risk assessment, this document describes the science supporting an interim science policy on the acceptance of alternative (in vitro, in silico, in chemico) approaches for identifying skin sensitization hazard. These approaches will be accepted in lieu of laboratory animal studies, most often the local lymph node assay (LLNA) in the mouse (OECD TG 429; OECD 2010a), and Buehler or maximization tests in the guinea pig (OECD TG 406, OECD 2010a).
