# NIEHS National Toxicology Program Tox21 Update

**Richard S. Paules, Ph.D.**  
**Acting Chief, Biomolecular Screening Branch**

***ICCVAM Public Forum***  
**NIH Natcher Conference Room Center, Room D**  
**Bethesda, MD**

**25 May 2016**

*(2011 – Present)*

## **Tox21 qHTS Phase II:**

- 10K compound library (8,948 unique; 13,129 unique solution IDs), ~ 3,000 each from EPA, NTP, NCATS (drugs)
- Screened 3 times at 15 concentrations in each “quantitative High Throughput Screen” (**qHTS**) assay
- qHTS assays (~ 60 assays) focused on:
  - Nuclear receptor activation or inhibition
  - Cellular stress response pathways and cytotoxicity

**Multiple workshops, webinars, meeting presentations, reports, publications, and websites for distribution of information rapidly and transparently to stakeholders**

## **Data Released to Public as Rapidly as Possible**

- via EPA Safer Chemicals Research website  
<https://www.epa.gov/chemical-research/research-evaluating-chemicals-adverse-effects>
- via PubChem ( <http://pubchem.ncbi.nlm.nih.gov/> )
- via Tox21 Toolbox ( <http://ntp.niehs.nih.gov/results/hts/tbox/> )
- via Tox21 Data Browser ( <https://tripod.nih.gov/tox21/index> )

## **Transparent Data Processing and Analysis Pipeline**

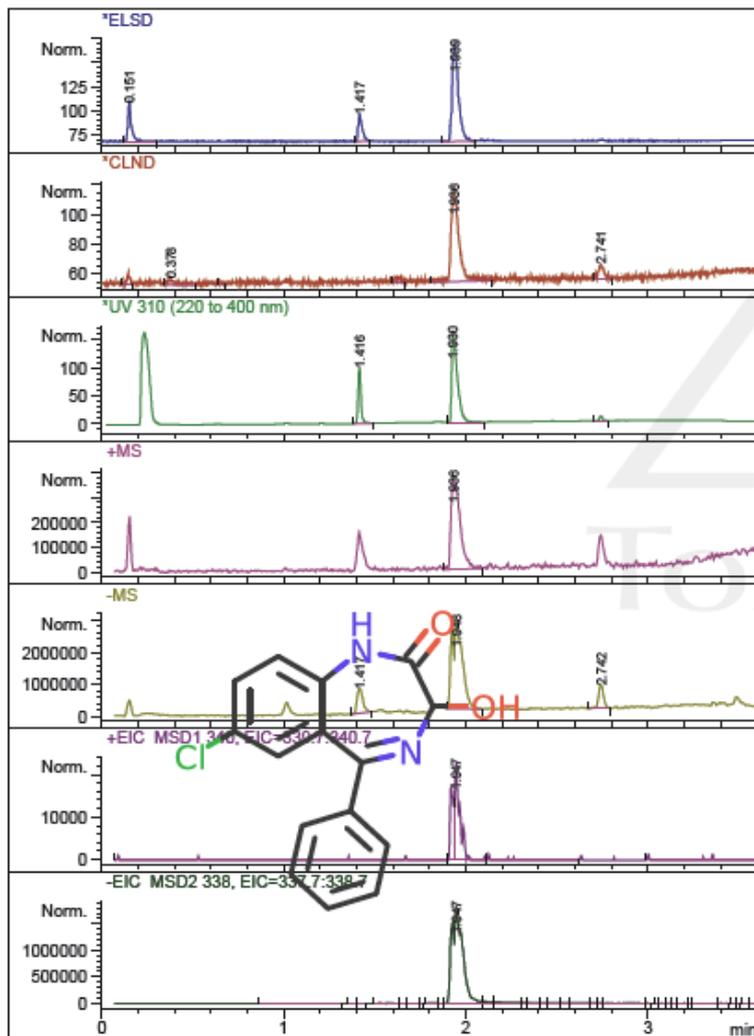

- ***Pay Attention to Warning Flags – Compounds & Calls***

# Tox21 Phase III

## *Improving on Biological Coverage and Human Relevance*

- Increased use of computational models to predict toxicity and metabolism.
- Increased focus on human cells with known ability to metabolize chemicals
- Increased focus on genetic variation to understand susceptibilities - Toxicogenetics
- Increased use of stem cells (both embryonic and iPS) to investigate the effects of chemicals on developmental processes
- Enhanced testing of compounds in lower organisms (e.g. zebrafish, *C. elegans*)
- Expand our understanding of biology by developing and implementing a high throughput and low cost approach to measure the entire transcriptome – HT-Transcriptomics

## *Improving on Biological Coverage and Human Relevance*

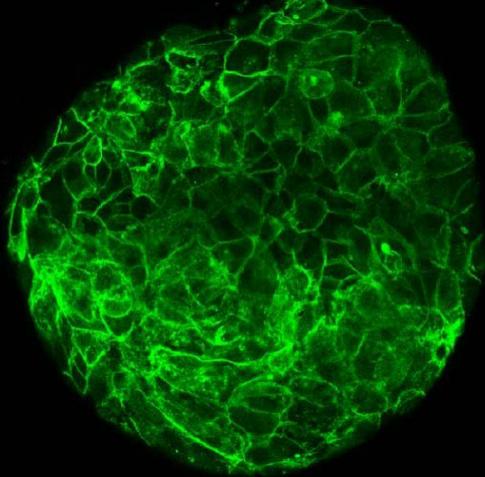

- Increased use of computational models to predict toxicity and metabolism.
- Increased focus on human cells with known ability to metabolize chemicals
- Increased focus on genetic variation to understand susceptibilities - Toxicogenetics
- Increased use of stem cells (both embryonic and iPS) to investigate the effects of chemicals on developmental processes
- Enhanced testing of compounds in lower organisms (e.g. zebrafish, *C. elegans*)
- Expand our understanding of biology by developing and implementing a high throughput and low cost approach to measure the entire transcriptome – HT-Transcriptomics

## *Improving on Biological Coverage and Human Relevance*

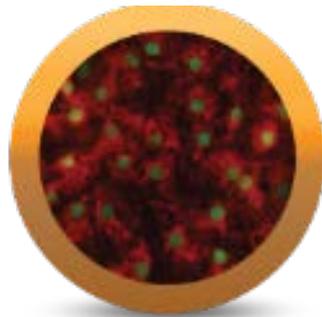

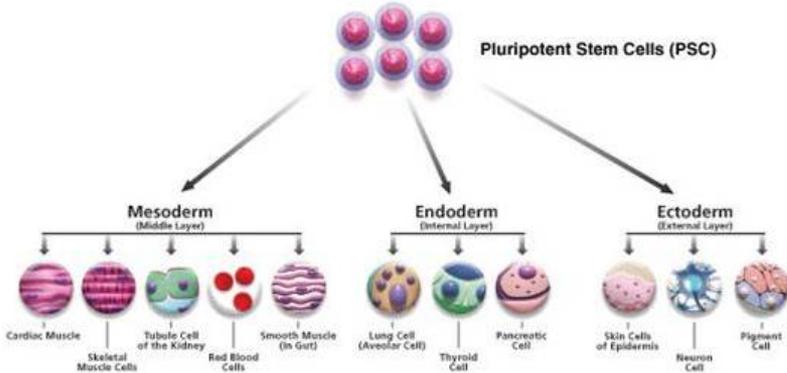

- Increased use of computational models to predict toxicity and metabolism.
- Increased focus on human cells with known ability to metabolize chemicals
- Increased focus on genetic variation to understand susceptibilities - **Toxicogenetics**
- Increased use of stem cells (both embryonic and iPS) to investigate the effects of chemicals on developmental processes
- Enhanced testing of compounds in lower organisms (e.g. zebrafish, *C. elegans*)
- Expand our understanding of biology by developing and implementing a high throughput and low cost approach to measure the entire transcriptome – HT-Transcriptomics

# Tox21 Phase III

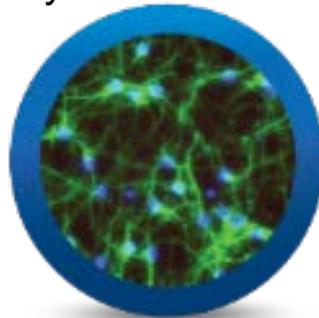

## Improving on Biological Coverage and Human Relevance

iPS Hepatocytes

iPS Cardiomyocytes

iPS Neurons

- Increased use of computational models to predict toxicity and metabolism.
- Increased focus on human cells with known ability to metabolize chemicals
- Increased focus on genetic variation to understand susceptibilities - Toxicogenetics
- Increased use of stem cells (both embryonic and iPS) to investigate the effects of chemicals on developmental processes
- Enhanced testing of compounds in lower organisms (e.g. zebrafish, *C. elegans*)
- Expand our understanding of biology by developing and implementing a high throughput and low cost approach to measure the entire transcriptome – HT-Transcriptomics

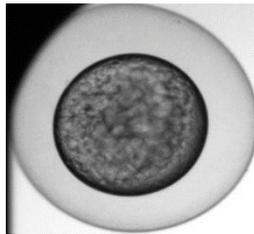

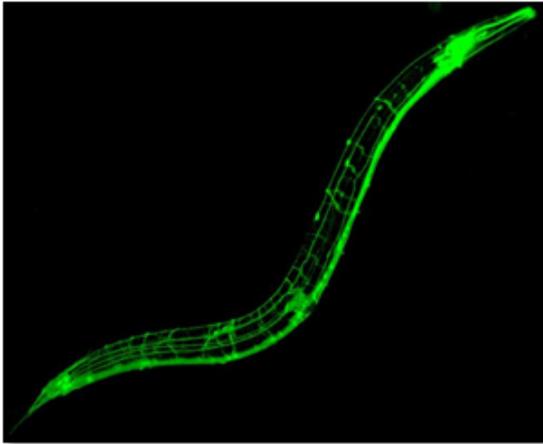

**Distribute sets of reference compounds**<sup>10</sup>

# Tox21 Phase III

## *Improving on Biological Coverage and Human Relevance*

5 days

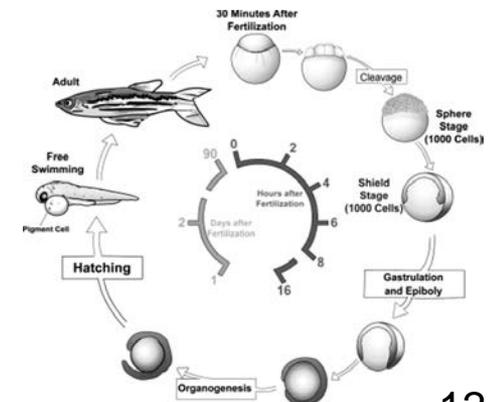

- Increased use of computational models to predict toxicity and metabolism.
- Increased focus on human cells with known ability to metabolize chemicals
- Increased focus on genetic variation to understand susceptibilities - Toxicogenetics
- Increased use of stem cells (both embryonic and iPS) to investigate the effects of chemicals on developmental processes
- Enhanced testing of compounds in lower organisms (e.g. **zebrafish**, *C. elegans*)
- Expand our understanding of biology by developing and implementing a high throughput and low cost approach to measure the entire transcriptome – HT-Transcriptomics

**Generating sets of reference compounds**

## **SEAZIT – Systematic Evaluation of the Application of Zebrafish in Toxicology**

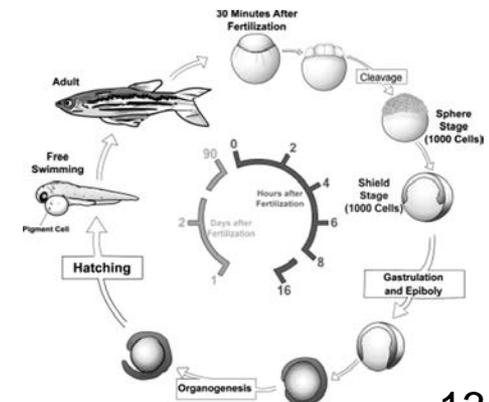

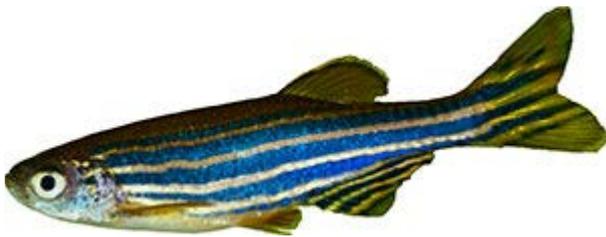

- A multipronged, multi-year program for the systematic evaluation of the application of zebrafish in toxicology (SEAZIT) studies by the DNTP.
- Aims:
  - to provide the scientific basis on which to make a programmatic decision on the further use of zebrafish in toxicological screening of chemicals to which humans are exposed during development and into adulthood.
  - provide fundamental knowledge on the use of zebrafish in toxicology, which will support further research endeavors by the academic community.

## **SEAZIT – Systematic Evaluation of the Application of Zebrafish in Toxicology**

- Aims (cont.):
  - Determine the influence of various protocol parameters on distribution within the zebrafish during development and into adulthood.
  - Assess the developmental origins of health and disease in zebrafish.
  - Determine optimal methods for evaluating zebrafish data to link it to phenotypic outcomes in mammals.

# Tox21 Phase III

## *Improving on Biological Coverage and Human Relevance*

- Increased use of computational models to predict toxicity and metabolism.
- Increased focus on human cells with known ability to metabolize chemicals
- Increased focus on genetic variation to understand susceptibilities - Toxicogenetics
- Increased use of stem cells (both embryonic and iPS) to investigate the effects of chemicals on developmental processes
- Enhanced testing of compounds in lower organisms (e.g. zebrafish, *C. elegans*)
- Expand our understanding of biology by developing and implementing a high throughput and low cost approach to measure the entire transcriptome –  
***HT Transcriptomics***

# *Tox21 HT Transcriptomics*

## *The Assumption:*

- Global “Omic” (Whole System) approaches can link perturbations with alterations in biological processes that result in toxicity and / or disease.

## *The Hypothesis:*

- Alterations in the **transcriptome** following exposures can provide:
  - linkage between chemical exposures and adverse biological outcomes (signatures/biomarkers),
  - linkage between *in vitro* and *in vivo* model systems, and
  - linkage between *in vitro* models & human pathobiology

## *The Ideal Solution:*

A rapid and low-cost High Throughput (HT) method to measure expression levels of **ALL GENES**

## *The Reality:*

- At this time, whole transcriptome technologies are prohibitively expensive for HT applications.
  - Target cost of \$25 - \$50 per sample.
- It will be necessary to focus on a **subset of genes** to use in a rapid, low-cost technology suitable for HT studies.

# *Attributes of a Tox21 S1500+ Gene Set*

1. **Diversity:** Capture the maximal expression variability and dynamics.
2. **Co-Expression:** Capture the **Sentinel** genes with maximal co-expression information to represent members of nodes or networks.
3. **Maximal Pathway Coverage:** Genes are included to ensure maximal biological pathway coverage.  
*1500 Sentinel Genes Bioinformatically Selected – S1500*
4. **Inclusion of toxicity and disease related genes:** Specific genes will be selected for their reported roles in toxicity-related and disease-related processes. Also include L1000 gene set from LINCS program.
5. **“Extrapolatability”:** This property refers to the ability to extrapolate or **infer** or **impute** with some accuracy the expression changes in all genes from those observed in this reduced set of sentinel genes.

## Develop Approach & Train on Rat Data Sets – Complete

- Pathway Concordance between Extrapolated & Measured Data ~ 0.9

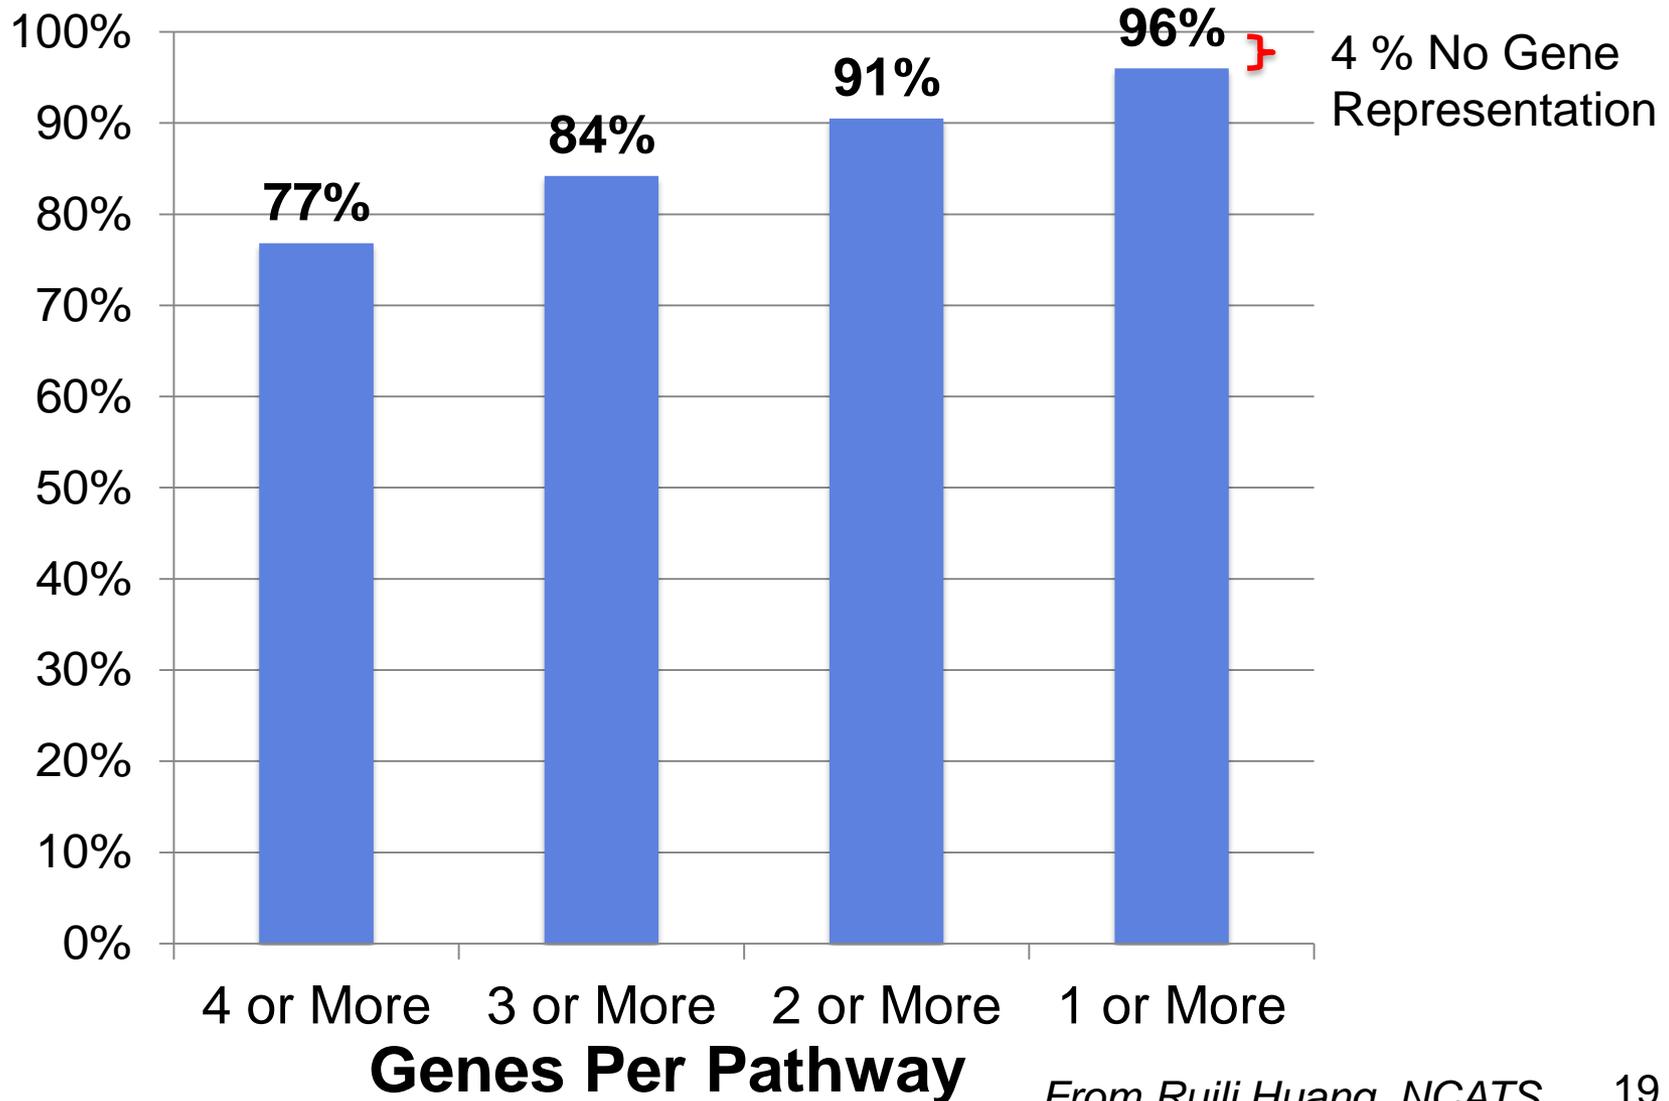

## Generate Human “S1500+” Gene Set –

- Affymetrix microarray human data sets (HG-U133plus2) were downloaded from GEO and 3339 series were manually curated.
- Human gene expression data sets that passed curation were subjected to our hybrid bioinformatic gene selection process
- **1500 gene set** identified bioinformatically in a strictly data-driven approach
- Additional genes were added from knowledge-based, nominated gene lists for a total of **2871** genes
- Human S1500+ Gene Set was released for public comment:  
<http://ntp.niehs.nih.gov/results/hts/s1500-gene-set/index.html>

# Human S1500+ Evaluation - NCATS BioPlanet

- Hosts the universe of public, curated human pathways (**2314 Pathways**)

From Ruili Huang, NCATS

## **Short Term**

Application to Cell Systems used in Tox21 Phase II Assays with a subset of the 10k set of chemicals

Application to Metabolically-Competent Human Cells (e.g. primary hepatocytes, 3D HepaRG spheroids, organoids)

Application to Human iPS cells undifferentiated and induced to differentiate along specific lineages

## **Mid Term**

Application to other species (rat, mouse, zebrafish, etc.)

Application to NTP archived material from rat and mouse studies

## **Longer Term**

Application of HT Transcriptomics to Human samples from molecular epidemiological studies and clinical studies
